Definitions in *The Partaceyist Statement*

Chapter 1 Definitions

God: The infinite and self-sufficient being who freely grounds all existence, coherence, and intelligibility.

Primordial Respect: The timeless ordering principle willed by God that grounds the intelligibility and coherence of creation.

Respect: The relational structure through which ideas correspond to causality, allowing reality to become intelligible and meaningfully ordered.

respect (undercapitalized): The structural coherence that allows relations to hold without contradiction or collapse. It is not identical with morality but underlies the possibility of moral evaluation.

Mutual Respect (philosophical definition): The direct, reciprocal, attentive, and objective constraint on causality that governs how things interact.

Individualized Respect: The indirect, interpretive form of attentive Respect that arises when consciousness becomes self-referential, generating agency and free will.

Relational Coherence: The condition in which relations, causes, and effects align intelligibly and directly, producing stability and continuity.

Direct Relation: A coherent causal interaction in which entities mutually influence one another with minimal distortion.

Indirect Relation: A distorted or incoherent interaction that weakens relational stability

and generates disbenefit.

Intelligibility: The capacity for reality, ideas, and relations to be coherently understood and meaningfully structured.

Relational Participation: The process through which entities mutually affect, sustain, and transform one another within existence.

Change: The temporal unfolding of coherence and incoherence within finite existence.

Entropy: The universal tendency of finite existence to transform through time via relational change.

Benefit and Disbenefit: The strengthening or weakening of relational coherence through mutually coherent or incoherent participation.

Evil: A parasitic distortion of relational coherence arising from indirect participation and finite deviation from mutuality.

Hierarchy of Fundamentality: The ordered structure of reality ranked according to ontological independence, descending from God through Respect into finite existence.

Chapter 2 Definitions

Emotional Market: An economic system in which price, pay, and production are determined through collectively expressed mutual respect rather than traditional scarcity-based exchange alone.

Standard Love and Respect Valuation Model: A mathematical framework used to calculate mutual respect, disbenefit, price, and social pay from collective human evaluations.

Mutual Respect (economics definition): Socially shared and collectively recognized

beneficial participation value between entities that goes into the collective rise.

Price: The quantified expression of social disbenefit used to regulate consumption and resource allocation within the emotional market.

Pay: The socially redistributed reward generated from aggregate mutual respect production across society.

Collective Rise: The decentralized national institution responsible for collecting, organizing, and equally redistributing generated respect wealth throughout society.

Respect Wealth: Digital economic value generated through mutually respectful actions, products, services, or institutions, but ultimately comes from the collective rise.

Neutrality: The protected condition in which interactions remain outside economic valuation when participants reasonably refuse emotional market participation.

Consensus Valuation: The process through which society collectively stabilizes economic value through aggregate mutual interpretations of benefit and disbenefit.

Partaceyism: A decentralized political and economic philosophy where mutual respect is the primary organizing structure for value, governance, and human cooperation. It replaces scarcity-based competition with collective participation in the production and distribution of social and economic coherence.

Chapter 3 Definitions

Partacey: A decentralized political society organized around mutual respect, collective participation, and localized governance.

People's Union: The decentralized network of councils, citizens, organizations, and

coalitions that forms the primary governing body of the Partacey.

Head Government: The symbolic and ceremonial national institution led by the head representative, possessing communicative rather than ruling authority.

Head Representative: The ceremonial figurehead of the Partacey who publicly represents the nation while remaining subordinate to the expressed will of the People's Union.

Council: A localized governing body representing a community within the People's Union, responsible for addressing issues directly affecting its constituents.

Coalition: A horizontal alliance of councils or organizations formed to cooperatively solve shared problems without centralized domination.

Coalitional Representative: A symbolic spokesperson elected by large coalitions to communicate collective positions without possessing ruling authority.

Political Courts: Judicial institutions that evaluate laws, elections, and disputes according to the constitutional and mutually coherent principles of the Partacey.

Mutual Law: A law intended to apply broadly across the Partacey through collective consensus and constitutional coherence.

Economic Reserve of the Partacey: The independent institution responsible for maintaining the stability of the emotional currency through reserve management, lending, and interest-rate regulation.

Representation as Sacrifice: The governing principle that representatives possess less personal freedom as they represent more people, making representation a duty of submission rather than domination.

Chapter 4 Definitions

Partaceyist Police: A law-enforcement institution funded primarily through voluntary donations and partially integrated into the emotional market, tasked with protecting societal stability while remaining accountable to mutual respect.

Limited Exposure Window: A temporary operational period in which police officers are partially removed from the emotional market while actively responding to non-mutual threats.

Disrespect Debt: A compensatory penalty issued to officers or individuals whose actions generate unjustified harm or excessive disrespect, requiring repayment before restoration of trust or authority.

External Accountability Bureau: A specialized bureau associated with local political courts that evaluates police conduct after active threat situations according to consequences and proportionality.

Convict Court: A judicial institution responsible for criminal cases, operating through professional judges and supermajority jury decisions focused on redemption and reintegration.

Redemptive Justice: A justice philosophy centered on rehabilitation, reintegration, and the restoration of mutual respect rather than punishment through suffering alone.

Behavioral Reintegration: The demonstrated ability to consistently participate in mutually respectful social relations without supervision, showing readiness to return to society within the proportional accountability period.

Mutually Coherent Good: The socially stable condition in which individuals align themselves with cooperative, mutually respectful participation within society.

Punishment-Based Prison: A prison model focused primarily on coercion, suffering, and containment, which reinforces individualized respect and high recidivism.

Redemptive Prison: A rehabilitative prison environment structured around stability, education, community, compassion, and mutual respect to cultivate long-term behavioral transformation.

Chapter 5 Definitions

Cake of Education: The Partaceyist model of learning in which knowledge is structured like a cake, where foundational concepts form the lower layers and higher-order abstractions form the upper layers, with all layers interconnected and accessible through multiple pathways of learning.

Top-Down Learning: A learning emphasis that begins with complex conceptual frameworks, intuition, and broad understanding before gradually stabilizing technical details and procedural rigor.

Bottom-Up Learning: A learning emphasis that begins with foundational procedures and technical building blocks before progressing toward abstract conceptual understanding and synthesis.

Conceptual Collapse: The moment within the Cake of Education when a learner becomes overwhelmed or disconnected from the conceptual structure of the subject, causing confusion and loss of educational direction.

Golden Zone of Innovation: The balanced intellectual state in which students know enough to confidently explore ideas while remaining open to correction, reinterpretation, and new evidence.

Experiential Education: A Partaceyist educational method that prioritizes engagement,

interpretation, creativity, and conceptual exposure over memorization and rigid procedural repetition.

Innovation Score: An evaluative metric used within Partaceyist schools to measure the diversity, creativity, and interpretive engagement of student responses within a classroom environment.

Partafaire: The Partaceyist healthcare system, combining donation-based healthcare funding, decentralized hospital management, ranked room assistance, and emotional market incentives to maximize mutual respect and accessibility of care.

Ranked Room System: A healthcare structure within Partafaire where all patients receive equal medical treatment, while differences in room rankings determine levels of luxury, comfort, and the percentage of healthcare aid provided by the Partafaire fund.

Chapter 6 Definitions

Competitive Game Theory: A model of interaction developed by John von Neumann and Oskar Morgenstern where actors are disincentivized from cooperation because uncertainty about others' preferences makes selfish behavior appear safer.

Peoplization: The transformation of sovereignty away from territorial domination and toward citizenship, social association, and cooperative relationships between people rather than geography itself.

Peoplized Sovereignty: A non-territorial or semi-territorial form of sovereignty where institutions are organized cooperatively through the people directly participating within them rather than through centralized geographic authority.

Directly Affected Property: A property framework in which ownership belongs to the individuals and communities whose daily lives, labor, or environments are meaningfully shaped by the property itself.

Military Defense Councils: Decentralized wartime organizations responsible for coordinating local defense militias within each council region of a Partaceyist nation.

Locbalism: A Partaceyist global trade system combining local and global trade, where products reset in value when entering a new emotional currency zone so that local populations retain sovereignty over valuation.

Zero-Dollar Policy: The Locbalist principle that products crossing into another emotional currency zone lose their previously attached respect wealth, causing value to be regenerated locally according to the importing society's conditions and interpretations.

Emotional Currency Zone: A geographic area composed of interacting sovereignties that collectively measure value through shared systems of mutual respect and emotional-economic evaluation.

Chapter 7 Definitions

Economic Materialism: A worldview inherited from life that organizes human society primarily around competition for limited resources, driven by supply, demand, and self-interest. It emerges from individualized interpretations of value and reinforces systems that prioritize material gain over mutual cooperation.

Supply and Demand (metaphysical form): A deeper structural pattern where scarcity and desire shape behavior, turning what people want (demand) and what exists (supply) into

forces that organize conflict and cooperation.

Agency: The capacity of a being or system to make choices and act within causal chains in a way that influences future outcomes. It represents the degree of control an entity has over its direction within the flow of events.

Morality: A shared interpretive system that regulates behavior within societies by defining what is considered acceptable, harmful, or cooperative. It blends mutual and individualized respect but is shaped by cultural conditions rather than being fixed or universal.

Hierarchical Drift: A social process where individuals gradually transfer responsibility and decision-making power to hierarchical structures or authorities. This reinforces centralized control and strengthens systems like Economic Materialism by reducing personal agency and distributed accountability.

Chapter 8 Definitions

Relational Reason: The idea that truth and reason emerge through relationships between beings and reality itself, rather than through isolated self-awareness or purely individual thought.

Entropy of the Universe: The ongoing causal flow and transformation of reality through changing relations, it is the deepest source of movement, development, and mutual interconnectedness.

Responsibilities: The practical and intellectual capacities people hold within society, whose distribution determines whether societies become decentralized and relational or centralized and hierarchical.

Organized Un-relational Reason: Systems of supposedly objective logic that detach

reason from lived relational reality, turning rationality into rigid abstraction that can be manipulated by Economic Materialism.

Economic Materialist Ideological Tools: Political, religious, or philosophical systems such as Feudalism, Colonialism, Mercantilism, or certain institutionalized religions that Economic Materialism uses to stabilize and reproduce itself.

Relational Efficiency: The idea that the greatest efficiency emerges not from competition, but from coherent mutual interaction between beings, systems, and environments.

Economic Rationalization: The reorganization of society, labor, and technology around efficiency, calculation, and optimization, where human responsibilities become increasingly subordinated to machine systems and economic control.

Chapter 9 Definitions

Materialism: A philosophy that determines the value of work through labor itself, treating labor as the fundamental source of value within economic production.

Idealism: A philosophy that determines the value of work through Supply and Demand, treating scarcity and market preference as the primary source of economic value.

Mutual Respect Labor Theory: The Partaceyist idea that the value of labor is determined by how much mutual respect and shared flourishing an action generates within society, rather than by labor-time or market scarcity.

Hard Working Success: A form of success built on sacrifice, scarcity, exhaustion, and continual toil, where value is measured through struggle and perseverance within Economic Materialist systems.

Lazy Success: A Partaceyist concept of success defined not by oppressive toil, but by meaningful, relational, and mutually fulfilling experiences such as friendship, family, leisure, creativity, and communal flourishing.

Communal Success: Success understood as the collective achievement of mutually respectful goals through cooperation, shared participation, and causal contribution rather than isolated personal gain.

Mutual Instruction: A form of workplace guidance where instruction emerges cooperatively through worker participation, shared judgment, and the direct needs of the work itself rather than through rigid managerial domination.

Relational Work: Work understood as a cooperative causal process between people, tools, materials, and communities, where labor gains meaning through its relationship to shared human flourishing.

Hard Work: Labor organized around struggle, exhaustion, and scarcity, where value is measured through toil rather than through mutual respect and shared flourishing.

Chapter 10 Definitions

Education Phase: The initial stage of the Partaceyist revolution focused on teaching people Partaceyist ideas and building early community understanding before institutions are created.

Direct Action Phase: The stage where Partaceyist groups begin forming real-world organizations and businesses to provide services based on mutual respect.

Business Phase: The stage where Partaceyist businesses grow, scale up, and begin

competing with or converting traditional Supply and Demand businesses by demonstrating higher efficiency through mutual respect systems.

Governmental Phase: The stage where Partaceyist businesses and networks coordinate politically to form a transitional governing structure, using collective action to replace existing Economic Materialist systems.

International Phase: The final expansion stage where the Partaceyist nation establishes global influence, develops trade systems with other countries, and spreads Partaceyist institutions internationally through economic and diplomatic integration.

Defined Action: A specific task performed by a worker (e.g., stocking items or completing reports) that is individually evaluated for its contribution and respectfulness.

Chapter 1

The Philosophy of Partaceyism

In the beginning, there was God, in the void before time and creation. God freely chose to Respect the idea of creation, even before anything existed. God's 'choice' here is not a temporal decision, but an eternal act of intention. This Respect, under God, was neither selfish nor selfless; it is not a moral attitude, instead it is the specific intelligibility that God imposed onto our universe that develops the attentiveness that I feel as respect. It is the relationship between our ideas and causality that gives us the power within to act attentively to what we imagine. Respect is logically prior to time, since God freely willed the structure of Respect to make our universe, including time, innately good. Respect is ontologically dependent on God even though it is timeless relative to creation.

Respect and the Structure of Reality

If our universe did not have Respect, then it would not have a stable distinction between time-bound events and timeless truths. If this distinction did not exist, then physical processes, such as a planet being torn apart by a black hole, could alter abstract

structures. Yet, mathematical truths, such as 1 + 1 = 2, will remain invariant regardless of any physical interaction. Therefore, our specific universe must exhibit a consistent coexistence between the temporal and the timeless.

God made creation in such a way that Respect came first, prior to time's existence, while materials came second. Genesis affirms this: "In the beginning God created the heavens and the earth. The earth was formless and empty, and darkness covered the deep waters" (Gen. 1:1–2, NLT). Genesis describes the earth's formless emptiness, suggesting that structured materials were not yet present. There was no entropy, no time-bound structure, no ordered matter or energy, only God establishing the framework through which creation could become intelligible.

What existed before form? God. He freely used the primordial order of Respect to ground creation itself. Through Respect, reality could take shape. Respect's timelessness coexists with time, forming the bedrock through which timeless ideas can correspond to physical existence. This process formed the ability for anything to be known, and once things became intelligible through the coexistence of causality and ideas, everything else followed.

God's will, infinitely perfect, is neither selfish nor selfless. It is causal yet transcends cause and effect. This primordial Respect functions as the relational grammar of creation, making reality coherent and intelligible. Though finite beings perceive only a small part

of this grandeur of intelligibility. Respect allows relations to hold, ideas to correspond to material reality, and structures to persist across time.

Goodness and Relational Coherence

Respect is therefore more fundamental than material existence itself. The good is the coherent flourishing of creation through participation in this relational order under God. Goodness is therefore not mere pleasure, survival, or material accumulation, but alignment with the deeper coherence through which existence itself becomes intelligible and relationally enduring. If we wish to build a society aligned with the nature of the universe, we should prioritize what is attentively respectful to all above mere material desire. Respect is the enduring framework of relational order under God's authority, allowing finite creation to engage meaningfully with the infinite. As Genesis observes: "Then God looked over all he had made, and he saw that it was very good!" (Gen. 1:31, NLT).

God's declaration of goodness reflects His free choice to express timeless Respect in a way that finite creation can understand. Therefore, God is not constrained by Respect, but freely wills it as the grammar of finite relationality.

Respect is thus the created, timeless ordering principle grounding intelligibility itself through coexistence with the time-bound universe. It was brought into being by God's

infinite intention and operates as the stable framework through which the cosmos functions. While moral authority belongs to God alone, Respect underlies the coherence of reality itself, preceding materiality and allowing finite beings to exist meaningfully within creation.

Mutual Respect and Change

Mutual respect is Respect expressed in time, which forms it into something different. It becomes the relational alignment of change with change, where causes and effects participate in coherent directness rather than distortion. Respect exists as a timeless structure, while mutual respect governs reciprocity within finite existence.

Mutual respect sustains stability through causal integrity and minimizes contradiction. In mutual respect, interactions approximate the ideal one-to-one relation, influencing change without unnecessary deviation. Indirect or distorted relations weaken mutual respect and generate instability. Mutual respect therefore guides change toward coherent relational participation.

The ideal one-to-one relation can be imagined as a flame moving with its reflection in a perfect mirror. When the flame moves, its reflection moves exactly as the flame moves. Abstract change influences abstract change. This is the bedrock of time-bound finitude.

Respect coexists with material interactions to constrain the intelligibility of change because non-selfish and non-selfless Respect manifests in time as mutual benefit expressed through relational participation. When entities mutually transform one another, they prolong themselves toward more stable and long-lasting states. Disbenefit occurs when entities fail to transform each other coherently. Without this dual dynamic, transformation itself cannot occur.

Mutual respect governs how causality is enacted through direct relational coherence, making benefit inseparable from mutuality. Change appears everywhere in the finite universe because all finite and time-bound existence depends on approximations of the ideal one-to-one relation. Change does not create this ideal relation; it reveals coherence or incoherence within it.

Entropy, Evil, and Distortion

Entropy is not merely disorder, but the directional unfolding of finite existence through coherent change. Entropy is the universal tendency of finite relations to transform across time, and since all of material existence is finite, all of finite existence participates in entropy. Entropy is not inherently destructive, for destruction arises through indirect incoherence rather than through change itself.

Indirect relations can generate disbenefit and destabilization, yet the underlying structure

of existence remains coherent. Evil, therefore, is structurally parasitic rather than foundational. The universe remains grounded in the direct relationality that allows anything to exist at all.

Disasters, cruelty, and unholiness arise through indirect relations that diverge from the ideal one-to-one relation. Agency can obstruct coherence, yet the universe still relies on the tension between affected and unaffected states to generate difference, and thus change itself.

Disbenefit presupposes prior benefit. A relationship must first exist before that relationship can be distorted. Without mutual participation, there would be no structure capable of either benefit or harm. Therefore, Evil depends upon the coherence it distorts and cannot exist independently from it.

This process of mutuality is metaphorically reflected in the laws of physics, from relativity to quantum mechanics, where interactions generate longer-lasting states and stable relational structures. These patterns reflect mutual respect embedded into the intelligibility of reality itself.

Respect is structurally stable but ontologically dependent upon God. Consequently, Respect must originate from an entity outside the universe's laws, since Respect operates without solely depending upon time. An infinitely ultimate being is therefore required to

initiate causality itself, transcending both time and the timeless structures of creation.

Yet one cannot fully know if this is the Christian God, since God desires faith rather than proof. As Hebrews states: “And it is impossible to please God without faith. Anyone who wants to come to him must believe that God exists and that he rewards those who sincerely seek him” (Hebrews 11:6, NLT). Even alternative interpretations of ultimate causality must still confront this beauty, that the universe’s causal structure undeniably fosters long-lasting coherence across creation. The universe was created with a purpose, and I see it through the universe tending through coherence. This is not an illusion, for my ultimate worldly end is to be fully a participant in entropy's unfolding, and what an honor that is.

Humanity and Individualized Respect

Yet not all is perfect. The non-selfish and non-selfless Respect became divided into two lower expressions once God created materials.

Mutual respect became the organic relational flow through which causal interactions sustain continuity across the universe.

Individualized respect emerged as localized expressions of Respect within finite agents.

This occurred because materials are finite. When materials were formed, Respect was ordained by God to communicate with them. Why did God command Respect to communicate with materials? To create beings capable of feeling the relational attentiveness of structure and its designer.

God used Respect to form humanity within the material realm. Mutual respect expresses the relational interactions of materials, while individualized respect expresses the agency of beings capable of interpretation and choice.

Individualized respect is the moral dimension of participation. It allows agents to align with relational coherence or deviate from it. Individualized respect is therefore a structured openness: the capacity to select among multiple coherent trajectories and either approximate the ideal one-to-one relation or distort it.

When humanity emerged, this same dynamic produced the possibility of sin. Crime, sin, and Evil arise through individualized respect detached from broader relational coherence. When beings cease acting mutually toward others, their interpretation of Respect becomes isolated from communal participation. Individualized respect becomes what one personally believes is respectful rather than what is mutually respectful among the community. This creates division, disorder, and conflict.

Individualized respect cannot guarantee benefit to others. It can produce disbenefit and

destabilize society. Yet at its ideal, individualized respect reflects the imperfect lived alignment of personal action with the deeper grammar of reality.

Mutual respect benefits society because it requires participation from others. It is inherently relational and grounded in direct cause and effect embedded within the structure of existence itself.

When living beings attempt to specify what counts as mutually respectful, those specifics must be determined collectively to follow causal mutuality, like the romance of life on Earth. Mutual respect is therefore a communal practice rather than an individual decree.

The Hierarchy of Fundamentality

From this understanding, a Hierarchy of Fundamentality emerges:

God – the infinite being that grounds everything in perfect coherence.

Primordial Respect – the coexistence of the timeless and the timely, used by God to formulate creation and ground the structure of reality.

Mutual Respect – relational coherence expressed through direct causal participation.

Change – the arrangement of coherences and incoherences revealed through time.

Human-Centric Morality – partially mutual and partially individualized moral systems created by societies.

Individualized Respect – localized interpretations of Respect driven by finite agents.

The Hierarchy of Fundamentality is structured according to independence. The more independent something is in being itself, the more fundamental it becomes. God stands at the top because He is infinite, all-powerful, and requires nothing outside Himself to exist. Respect follows because it transcends time and grounds intelligibility itself. Mutual respect exists beneath primordial Respect because it is Respect expressed within finite time. Change emerges beneath mutual respect because change reveals the arrangement of relational coherence across temporal existence. Change reveals relations, while mutual respect governs the coherence of those relations.

Human morality exists beneath change because morality shifts historically and culturally. Beneath morality lies individualized respect, the most localized and unstable expression of relational interpretation.

Within this framework, Evil is not a rival force to good. Evil is a distortion arising from finitude. Reality is a unified trajectory descending from infinite grounding through

timeless Respect into material participation. Evil is a knot in this rope, formed when finite agents fail to fully integrate into the whole.

Natural evil, such as hurricanes, is impersonal change. Suffering emerges when conscious beings attach themselves toward ends misaligned with the deeper structure of relational coherence. Moral evil occurs when beings prioritize power, survival, or selfish preservation over mutual participation.

Yet, Evil remains structurally parasitic. It wounds but does not sever the rope. Freedom allows deviation, and deviation allows moral ascent. Humanity must overcome selfish attachment and recognize the deeper coherence underlying existence itself. The rope remains whether we acknowledge it or not, and that gives me hope within God's creation.

Mutual respect, goodness, and the experience of Evil are inseparable from the causal structure of the universe. When we experience goodness, we experience a state of coherent longevity aligned with the relational flow of existence. Mutual respect becomes the practical expression of this principle among finite beings, grounded in communal, causal, and ultimately infinite reality.

Economics and Relational Order

What is more relational within daily human life than economics! Economies organize

human relations at scale, which makes economic systems moral expressions of humanity's understanding of relational coherence.

If this metaphysical structure truly governs existence, then human societies should reflect it.

Yet, many economic systems encode assumptions that contradict the relational structure of reality. Instead of encouraging mutual participation in coherent change, they prioritize selfish preservation and ultimacy in how to handle scarcity.

The most influential doctrine that emphasizes this is our current status quo.

The status quo appears natural, but it is fundamentally an economy of indirect relations. It convinces societies that meaning, resources, and goodness are inherently more scarce than they actually are. In doing so, it generates confusion, conflict, and unnecessary suffering from its deeming as ultimate.

Our economy is a distorted economy. It is like a generator attempting to run from a power line rather than from the generator itself. The power line appears strong, but it is fragile and secondary. The true power source lies deeper within the structure of relational coherence. To build a society aligned with the nature of reality, humanity must rediscover that source.

That source is Respect.

Chapter 2

The Partaceyist Economy

In essence, this insight within the philosophy of Partaceyism, reveals to us that the two lower forms of Respect are within all materials across the entire universe. Within the context of the emotional market, mutual respect is reflected in actions, goods, or institutions that affected participants collectively perceive as socially beneficial through shared intelligibility of time-bound value. Therefore, everything within the universe, including people, has a different balancing of mutual respect and individualized respect. This dynamic is all from causality, which is the baseline structure of mathematics, since the cause of one plus one becomes the effect of two.

The Emotional Market and Value

Henceforth, since mathematics is causal, we can create a mathematical model to calculate the benefit and disbenefit within products, which I call the Standard Love and Respect Valuation model. It goes like this: if a group of three kids hanging around in a park had different irrational views on how a random apple benefited them, they can rank the apple

on a specific ranking system, of 1 to 10. Henceforth, the three kids valued the apple:

4/10, 6/10, and 2/10, respectively.

Therefore, we need to find the total mutual respect, which is:

4 + 6 + 2 = 12.

Then, we need to find how much mutual respect is within the total possible combinations of the values given within the ranking, so ten times three equals thirty. Therefore:

12 / 30 = 0.4.

Then, to find the disrespect percentage within the apple, we subtract 0.4 from one:

1 - 0.4 = 0.6.

This gives us 0.6, or 60% disrespect within the apple. This number is the cost, or non-benefit, that the three kids deemed the apple to be, but the price regarding respect wealth can only be known after calculating the pay. Regarding the transactional reward that the kids get from the apple, since all three kids contributed towards the valuing of the

apple, it is only fair that the three kids should get an equal share of the value of the apple. In an emotional market, payment is decided by calculating the total respect, using the 1-to-10 ranking method, and dividing it by the total number of opinions that were given. Therefore, price and payment are separate.

Within the emotional market, price functions as a measure of social disbenefit, while pay functions as a distribution of socially generated benefit. Price exists primarily to regulate consumption and resource allocation, whereas pay exists to distribute the gains of mutual respect production across society. Henceforth, the generated digital respect wealth distributed from the transaction will be:

12 / 3 = 4 respect wealth per person.

Therefore, the price function rule derived from this transaction will be:

4 * 0.60 = 2.4 is the price of the apple for the whole group in respect wealth.

These variables can then be abstractly estimated into USD by finding a common mediator between mutual respect and USD, which is that both mutual respect and the USD use time to determine their value. The mutual respect to USD conversion can be done by using the maximum possible mutual respect within a given transaction, which in this case is 10 * 3 kids = 30. After that, the closest thing that the USD has to a consistent time

bound unit of value is the minimum wage, since the minimum wage is a minimum unit of pay per hour of labor done. The federal minimum wage is not a perfect one-to-one conversation to emotion. Yet, we can estimate value by comparing the strongest emotional impact to the smallest amount of fixated money to relate it towards. This shows how much value is created in such an exchange.

The federal minimum wage, which, according to Federal and State Minimum Wage (2025), is, “7.25” (1). Therefore, if the maximum possible mutual respect is multiplied by the federal minimum wage, then the maximum USD value will be $217.50. To make this value fit into the emotional market, we times the disrespect percentage of the apple by the maximum USD value. Therefore, it can be concluded that the USD abstract disbenefit of the apple is:

0.6 * $217.50 = $130.50 is the USD-equivalent abstract disbenefit of the apple.

To get the actual sticker price that people would pay for, we need to recouple the group of kids and the value of the apple itself. To do this we will need to divide the USD-equivalent abstract disbenefit of the apple by the maximum mutual respect possible within the transaction. This comes out to be:

$130.50 / 30 = $4.35 is the price of the apple in USD.

This USD conversion is not necessary for the operation of the emotional market itself, but serves only as an illustrative bridge for comparison between contemporary monetary systems and the emotional market. When we look at pay, we can convert the digital respect wealth pay of 4 into USD by doing 0.4 * $87, which we get $87 by subtracting the USD maximum value by the USD-equivalent abstract disbenefit, which is $217.50 - $130.50 = $87. This gives us the difference between what is non-beneficial and what is possible, which can only be what is beneficial within the transaction. Henceforth, the conversion from emotional currency to USD for each kid valuing the apple would be:

0.4 * $87 = $34.80 is the pay per person for the transaction of the apple.

The Collective Rise

This apple example demonstrates the foundational principle of the emotional market: price emerges from disbenefit, while societal pay emerges from collectively generated mutual respect. However, for such a system to function beyond isolated exchanges, society requires a mechanism capable of aggregating and redistributing mutual respect on a national scale. This necessity leads to the establishment of the collective rise. The collective rise is an organization that is run by a decentralized bureau of unbiased elected professionals that collect and organize the nation's distribution of its gained respect wealth. This is enforced by blockchain, which prevents one person or organization from controlling the collective rise. Hence, guaranteeing the security of the pay of everyone

within the Partacey.

The collective rise works by collecting the gained recorded public mutual respect generated for a set period of time, typically a week or two. After the opinions are collected, the total generated mutual respect of the nation is divided by the total number of citizens within the nation. This is done because when you give an economy a currency that is derived from one's own respect, if you did not distribute the currency equally amongst society, then that society will be sourcing individualized respect from the greater Respect.

Individualized respect will lead to chaos and division within the nation because everyone will value the currency differently. This will mean that inequality will be sourced from the power of opinions rather than the mutual respect for opinions themselves. This could be dealt with by incentivizing the different interpretations of what is respectful within people to come to a consensus, by the unified desire for socially beneficial profit.

Within an emotional market, cooperation creates more mutual respect than competition. Since respect wealth is socially redistributed rather than individually accumulated, participants become economically incentivized to coordinate around shared understandings of what constitutes mutually respectful production. This cooperative incentive encourages participants to standardize shared definitions of mutually respectful production, making large-scale economic coordination possible. If no consensus is

achieved, then those that are not cooperating will not be able to determine the mutually respectful value of the product, since they lack the common ground to form a mutual consensus on price and payment. Therefore, the respect wealth is redistributed equally among the citizenry of the nation, so that the society can source the currency within mutual respect in its most profitable form for its participants.

This will not lead to economic stagnation because if people value the aggregate products of the emotional market as more mutually respectful than the last pay period, then the collective pay of the nation will increase. Henceforth, increasing the purchasing power of the nation. Therefore, people are incentivized to produce more mutually respectful actions within an emotional market, so that everyone can gain more within their own mutual respect and labor.

In essence, mutual respect is generated through social interaction, aggregated by the collective rise, redistributed as digital respect wealth, which increases societal pay, which then incentivizes further mutual respect generation.

The increase in aggregate mutual respect within the emotional market will lead to cheaper prices and better quality goods and services within the emotional market. Therefore, the driving force of the emotional market is to decrease prices, to increase the pay of all, which will increase the purchasing power of the citizenry. This will in turn lead to people wanting to decrease prices even more, so that their purchasing power can

increase, so that more goods and services can be bought. This happens because firms derive compensation increasingly from collective respect generation rather than from price extraction. Innovation becomes directed toward efficiency, sustainability, and social trust rather than scarcity maximization.

Artificial Intelligence and Economic Scaling

This economic structure of the emotional market can go up in scale by Partaceyist businesses standardizing their opinions of standardly unique products, like different brands of the same type of product or different products altogether. These standardly unique products can have a standard set range, since they are bulk items that all relatively have the same impacts to the environment and to society. Once broad standards of mutual valuation are socially established, these set ranges processes can be technologically scaled through artificial intelligence systems capable of processing large quantities of public feedback, such as people paying in grocery stores.

The customers will need to press a button, on a cash register, or online, and talk to a microphone about what they think about the products that they buy within a given range, like one out of ten. The single opinion of the customer, on its own, very slightly affects the price and pay derived from the product. This is due to the vast number of people who directly affect the state of the product's current form.

This is done to keep the value of products within the emotional market in alignment with what society values that specific standardized and uniquely developed product. The customer only needs to say one number, like six out of ten, to the artificial intelligence algorithm. This allows transfers of value within emotional markets to go quickly and efficiently, which can facilitate the scaling up of the emotional market to larger economic structures.

The number of opinions that dictate price is relevant to the scalability of the emotional market, since the disrespect percentage will never go over one. Each transaction produces a temporary valuation snapshot, while the long-term valuation of products evolves through continued public interaction over time. Therefore, no matter the size, the disbenefit can be calculated within an affected group within the emotional market. Over time, these AI algorithms could continuously recalibrate product valuation according to changing social attitudes, environmental impacts, and production methods. The product valuation would be dynamically derived from the aggregate opinions of customers and workers across the lifespan of the product in its presently produced form.

Throughout the development of this economic philosophy, a common criticism that arose was that emotional valuations are inherently subjective and therefore incapable of producing stable economic coordination. Although individual valuations are subjective, aggregate mutual valuations stabilize into predictable social patterns, allowing functional economic objectivity to emerge at scale. Since large-scale valuation draws from millions

of interactions across time, isolated attempts at manipulation become statistically diluted within the broader aggregate behavior of society. Repeated malicious or artificially coordinated valuation patterns can also be identified by decentralized AI auditing systems within the emotional market.

The various artificial intelligence algorithms can determine the price and pay derived from every purchase with ease. As long as society has the technological capabilities necessary to have seamless artificial intelligence algorithm cashiers' stations within all major industries of the Partaceyist economy. This system can sustain itself only if mutual respect remains balanced between producers, consumers, labor, and the products themselves. If a relationship becomes exploitative, the emotional market begins generating disbenefit rather than collective gain for that relationship.

Accumulated respect wealth holdings can be lost within an emotional market. This can be done by someone adding respect wealth to the stock of a Partaceyist business. Yet, if disrespect surrounding that Partaceyist business increases, then the possible pay from such a stock will decrease, converting into increased social disbenefit, and thus becoming more expensive. This becomes a loss of potential mutual benefit rather than a traditional monetary loss. This is due to the lack of a guarantee for anyone to regain that respect wealth from that investment.

So, that possible pay is effectively lost. Therefore, investments can possibly lead to lost

respect wealth, yet since the people control the production of respect, I think that this will not be a massive aggregate loss in the emotional market, but only time will tell. Also, within an emotional market, people should be able to buy and sell their emotional currency via the sale of stock investments and donations within institutions that are based on the value of their generated mutual respect. This can increase the overall goods within an economy, in direct relation to the production of mutual respect.

Neutrality, Genuineness, and Religion

However, if all human interactions were forced into systems of valuation, the emotional market itself could become socially coercive. Therefore, the emotional market has a few rules that need to be implemented to secure fairness within the emotional market. For instance, sarcasm, or funny events that are not for profit, and anything that people reasonably would not want to record into the emotional market falls under the economic status of neutrality. Neutrality means that the trade interaction does not happen, since one side of the transaction decides that the trade is not mutual. If the trade is more than two people, then if two-thirds of the people who are directly affected by the trade refuse to trade, due to valid moral issues, then the trade will not happen. When it comes to individuals, within rational reasons, people can choose which actions they can record and value within the emotional market.

Although, if people do something that is not mutually respectful to other people, like

murder or stealing, then that action, if recorded, will be valued by others directly affected by that very negative non-mutual action. Neutrality is meant to give people a time-based personal life, free from the constant respect wealth generation. The rights of neutrality would require constitutional protections to prevent social coercion from forcing all human interaction into economic valuation. Yet, it is within the choice of the individual to decide what things to be neutral, within rational reasons to the given circumstances, in accordance with the law of the Partacey.

The concept of neutrality shows that the establishment of an emotional currency is more important than a society having genuine emotional experiences. This is supported by University of Michigan marketing professor, Aaron Ahuvia (n.d.), who states that, “The fact that stands out from these figures is that even when one looks at ‘real’ love, 72% of the respondents said that they loved something other than a person with whom they have a close personal relationship” (189). This study uses a range of 0/10 on what people love for a wide variety of things and 72% of the time people choose the things that economically support them rather than the things capable of producing human forms of love, like family, friends, and partners. In fact, this study goes further, Aaron Ahuiva (n.d.) states that, “When love is defined loosely, the most loved items are recreational activities, commercial products of food and clothing, natural items such as pets and water, art forms and creative activities such as making art or working. However, when love is limited to what respondents deemed to be real love, “high culture” items such as art, and natural items such as animals and landscapes, gain dramatically in relative popularity”

(189).

The quote above showcases that love is associated with ‘high culture' items like art and nature when defined mutually by others, but when love is loosely defined, it can be consumed by individual preferences, which tend to be people with materialist and egoistic mindsets. Without mutually agreed standards, emotional value fragments into isolated personal interpretations, making collective economic coordination unstable.

In effect, individualized respect causes the commodification of respect to be a force of oppression for genuineness; just look at Social Credit within China. Individualized respect-based love dominates our current society, so our current understanding of love will lead to the commodification of respect, which will lead to the development of oppression. Although, if the commodification of respect is sourced in mutual respect, then the genuineness of respect is not lost, but elevated in economies of scale. This is because people within a mutually respectful social environment can decide within their community on what mutually beneficial interpretations of respect should be obeyed or not.

If we develop a Partaceyist society, then we will inherit incentives to become more mutually respectful, which facilitates a democratic framework to determine what is respected or not. When we embrace these incentives, we will organically bake genuineness within the consensus of each decision towards each product. If our valuing

of what is respectful was by individualized respect, then the chaos and division will lead to an anarchic framework, facilitating the rise of tyranny and oppression, by the lack of consensus within the community. Why is this the case? It is because if you cannot help yourself, you cannot help others, especially when considering one's economic means. Thus, the most genuine action of all is to tap into the mutual interpretation of Respect within a given action, since it is an action done for others, not for solely you.

This sacrifice of a period of genuineness is done to genuinely support yourself economically to then help the world become a holistically better place for everyone to live in. This can take the form of sacrificing what you want, when it goes against the mutual respect of the community, and I see no greater form of genuineness than that. Therefore, these quotes from Aaron Ahuiva show that a genuine world for all is not as mutually good for all as a prosperous world for all, under the power of consensus.

Yet, despite the emotional market’s attempt to calculate socially beneficial value, Partaceyism does not claim that all forms of respect are economically measurable. For instance, some will argue that worshiping God is a genuine act, therefore the genuine is more important than the prosperous. Although, the respect I am currently looking at is the respect that is influenced by materials and psychology. The respect that humans know and understand the best. Therefore, when one argues that respect is incalculable, they are not talking about the finite respect of our communities, but the infinite intelligibility of Logos from God. An intelligibility so vast that it can be scholarly proclaimed as

incalculable.

Therefore, the emotional market does not use God's respect to value products, since it will turn the church into a place where people worship God for wealth rather than for their own sake. When coming to the Lord, people need to obey the respect of the Lord, not use the respect of the Lord. Therefore, churches must be separated from the emotional market, which makes churches not able to generate mutual respect towards the collective rise of the nation.

Within a Partaceyist economy, churches are funded by donations from their congregations and those who value the message of the church by only donating to the church. Yet, church donations will not generate any mutual respect for the collective rise, since the people giving to the church for their love for God will see the value of their actions as infinite, since it is connected towards an infinite being. This means that transactions within and towards the co-owned communal property of a church must be deemed incalculable, separating the church from the emotional market, to maintain the purity of the message of the church.

The only fully genuine being is God, so we as humans should try our best to be genuine towards God. Any genuineness we have cannot compare to the infinite genuineness of God. We will fail to be genuine, but we must also constantly try. For what is the point of being genuine? If not having prosperity negates the ability of those to live genuine lives,

then without prosperity the genuine cannot flourish. Thus, opinions in an emotional market should not serve the maximization of genuineness, but the maximization of prosperity, which is calculable and objective to all. We must give prosperity to the masses to give everyone the opportunity to be genuine within the economy.

Thus, within Partaceyism, prosperity is treated as the social foundation from which genuineness can progressively emerge. When society collectively secures the material conditions for human flourishing, individuals gain the freedom to pursue more genuine forms of life, community, and spiritual meaning than ever before. Therefore, if using emotions as a currency leads to more mutually sustainable prosperity then that is more important than if those emotions reflect their genuine form.

Debt, Inflation, and Economic Stability

Another thing that Partaceyist economies will change is the concept of debt itself. In a Partacey, debt is when someone or an institution uses borrowed digital respect wealth to pay for something. The emotional market makes people able to pay their debt by doing good deeds. Yet, the more you reliably pay your debt, the more mutually respectful you are to the debt collecting organization. Therefore, this increase of generated mutual respect can increase your pay and the pay of the debt collecting organization, via the collective rise. As debt is repaid reliably, both the debtor and the collecting organization gain respect wealth, reflecting their positive contribution to the collective rise. This

creates a reinforcing cycle in which responsible repayment increases one's economic capacity. Thus, allowing one's ability to work hard and fairly participate within the system to be the engine to lift them up from poverty.

Within a Partacey, debt is a good thing, since people can get things that they currently need, but don't have, with debt. Yet, if the people pay debt reliably, debt becomes a constructive tool rather than a liability. Debt within a Partacey has the possibility to be an income of sorts. The more debt that is respectably handled, then the more respect wealth people have that can be donated or invested into organizations. These organizations will have their overall contributions towards the collective rise increase with these increases in investments and donations, which increases the pay of everyone within the society. This then decreases the possibility of endless debt for everyone, since they all have more respect wealth to get out of debt.

A practical real-world example of how this debt system affects every life is seen with loans. People that do more mutually respectful actions to loan organizations get lower interest rate loans, since the loan organization and the borrower will get paid more from the collective rise, from this interaction with the more mutually respectful person. Yet, these policies are limited by social impacts, since if loan organizations get too unfair to the population by expecting too much mutual respect, then the masses can see this as disrespectful, which can lead to loan organizations lowering expectations towards the population to reasonable levels. The same is true for those who try to game the system by

living on debt. If people view their reliance on debt as more than necessary, then people can view it as disrespectful. Therefore, making the person's means to use respect to pay off debt less profitable, until the person pulls himself from his own bootstraps.

Also, within the emotional market, there is a limited range in which prices can be established within products in a Partacey, since all products will need to have their total disrespect plus their total mutual respect equal one. This can prevent producers from manipulating the emotional market in their favor, since there are more limited options to price goods and services than to gain from the pay from those very goods and services.

At this stage, a major economic concern naturally arises: if mutual respect continuously generates new pay throughout society, what prevents the emotional market from collapsing into inflation? Many people I talk to assume that inflation would naturally emerge from the unrestricted production of mutual respect, but this misunderstands how the emotional market functions. They see the mutual respect within the economy as a non-fungible good, which creates a non-fungible economy. Although mutual respect is non-fungible on its own. The publicly expressed actions of citizens are fungible because they must be socially exchanged and recorded through interaction. Mutual respect only gains economic value when tied to a product, service, action, or relationship between participants.

Therefore, pay within the emotional market becomes fungible because mutually

respectful activity always requires at least two participants. This can occur between customer and producer, customer and worker, or buyer and product. Once a collective rise period ends, the respect wealth generated during that period becomes economically constant. That wealth does not endlessly fluctuate on its own. It only changes form when reinvested into another action, product, stock, or institution.

Because of this, disrespectful actions do not devalue all respect wealth across society. Instead, those actions generate higher prices specifically tied to the disrespect they caused toward people, goods, or services. The respect wealth itself remains stable because it was not created through that disrespectful act, it is only created through respectful acts. What changes is the valuation surrounding the specific action within that collective rise period. In this way, the emotional market uses non-fungible value to determine prices, while pay itself remains fungible. This gives society the ability to collectively influence prices through the structure of the collective rise.

Some may still fear that widespread freedom to generate mutual respect would inevitably create inflation. Yet, value itself is produced through social interaction. As the Brazilian economist André Roncaglia de Carvalho et al. (2018) explains, “As the production structure moves toward more sophisticated and technologically advanced sectors of the economy allowing a high growth rate of demand and low unemployment be sustained in an environment of stable and low inflation” (562). This matters because increasing social and technological connectivity does not necessarily produce inflation. Greater

coordination can instead stabilize economic activity. Within the emotional market, mutual respect functions as this connective force. It reduces destructive competition, limits information hoarding, and allows more people to participate in production, innovation, and long-term planning.

This form of competition resembles sports rather than war. Partaceyist businesses still compete, but they begin from a baseline of mutual respect. Participants cooperate, compete, and then return to shaking hands afterward. Traditional markets often push competition toward destructive zero-sum behavior, where one side must weaken the other to survive. The emotional market reverses this logic. Mutual respect becomes the foundation, while individual success develops from the shared social base that gives rise to it.

Within the emotional market, price percentages are determined by disbenefit, or (1 − mutual benefit). As collective benefit increases, prices decrease. Prices therefore reflect social usefulness rather than scarcity alone. Yet because prices fall as mutual respect rises, prices cannot fully determine compensation for producers and workers. Payment must instead be separated from price and derived from the aggregate generation of mutual respect across society.

To prevent inflation, the Partacey organizes the economy around a central principle: when people purchase goods or services, the emotional currency equivalent to that price is

removed from circulation. This deletion is the closing of the emotional loop in the same way that fully expressing mutual respect completes a mutually respectful action. This policy transforms price into something temporary rather than endlessly circulating. The emotional currency attached to price disappears once the transaction is completed. As a result, the supply of emotional currency remains elastic and cyclical. Economic activity continuously renews the currency base through socially beneficial action rather than through money printing, as seen within contemporary societies.

If preventing inflation is viewed as mutually respectful toward the community, then Partaceyist businesses profit socially from helping stabilize the economy. Prices still exist, but their role changes. They become an outlet through which mutual respect exits the emotional market once an economic action is completed. In this sense, every purchase closes one emotional cycle so another can begin. This creates a self-renewing economic structure. Every purchase reduces the circulating supply of emotional pay within individuals, which then necessitates the continued production of mutual respect for society to maintain prosperity. Businesses are therefore incentivized to reduce inflationary pressure because stabilizing the emotional market increases the collective respect wealth generated through the collective rise.

Investments function differently within this system as well. Investments are not purchases because they do not consume goods or services. Instead, investments place mutual respect into the future growth of a Partaceyist business. In this sense, investing resembles

gifting more than buying. The investment supports the future capacity of that institution to generate mutual respect within society. As productivity becomes increasingly tied to mutual respect generation, economic expansion depends less on scarcity pricing and more on the social efficiency of production networks. People begin coordinating not only what to produce, but also when to produce mutual respect and when to use it as a currency, allowing the emotional market to expand sustainably rather than chaotically.

Therefore, purchasing power becomes directly tied to the continued production of mutually beneficial activity. Disbenefit is economically removed through purchasing, while respect wealth itself grows more than what is lost through the generation of mutual respect. In this way, businesses become less dependent on extracting profit through high prices and more dependent on maintaining socially respected practices.

Prices can still contribute toward offsetting the social and material costs of production, but they no longer dominate the finances of the business. Donations, investments, and mutual respect generation increasingly sustain institutions instead. This also weakens the traditional incentive for businesses to raise prices whenever wages increase, because worker compensation is no longer structurally dependent on commodity margins alone. Within the emotional market, payment funds wages directly, while workers can voluntarily donate or invest back into the institutions they value. As collective rise payments increase throughout society, it leads to an increase in donations and investments into mutually respected businesses. Businesses grow not simply because they sell more

products, but because society increasingly values their role within the society.

Over time, institutions become less dependent on survival through commodity pricing and more dependent on maintaining socially beneficial production practices. Pay becomes the central economic priority, while prices are increasingly free to decrease in service to society as a whole. Investments and donations would naturally flow toward institutions viewed as mutually respectful and socially valuable.

Decentralization and Participation

For this system to function fully, people must have meaningful access to authority itself. The emotional market can only advocate for the mutual benefit of all if society is organized cooperatively around shared participation. As legitimacy becomes increasingly tied to public mutual respect generation, rigid hierarchical structures lose economic efficiency compared to decentralized cooperative institutions. Decentralized institutions adapt more rapidly to localized mutual valuations, both in responsiveness and in allocation toward public demand. This creates an incentive for governments and businesses alike to decentralize authority structures. As authority becomes more accessible, personal freedom increases because those in power economically benefit from respecting others rather than dominating them.

Over time, this process leads toward the central goal of Partaceyism itself: a society

where everyone increasingly becomes a participant within governance. This is why the philosophy is called Partaceyism, because the people and the government ultimately become one shared system of participation built upon mutual respect, or a-part-a the government.

Chapter 3

The Partaceyist Governance

The government of a Partacey is separated into two parts: the People's Union and the Head Government. The Head Government is the lowest level within the hierarchy of Partaceyist governance. The person elected to the office of head representative possesses no direct ruling power other than propagandic and ceremonial influence. The role of the head representative is to act as the figurehead of the Partacey, in which the frustrations and grievances of the nation can be directed toward a singular office rather than toward the people themselves.

The head representative is similar to the British royal family, in that he or she possesses ceremonial authority within foreign visits, public announcements, and diplomatic affairs. The head representative may formally vote on behalf of the nation in international matters, yet the head representative is required to vote according to the expressed will of the People's Union. If this is not done, then the head representative's political career will be placed in jeopardy. Therefore, the office of the head representative is not a position of domination, but a full-time office of submission to the people.

The Head Government is also supported by organizations that provide the resources necessary for the head representative to remain professional and presentable to the Partaceyist nation. Thus, the Head Government exists so that the people can focus on productive participation within society while a centralized symbolic institution maintains national unity and communication. The Head Government stabilizes the nation while remaining subordinate to the People's Union.

The People's Union and Coalitions

Wait, what is the People's Union? The People's Union is the decentralized body of councils that forms the beating heart of the Partacey. The citizens are the foundation of the People's Union and vote on policies, representatives, constitutional revisions, and the office of the head representative itself. The councils are organized similarly in scale to counties within the United States of America. Representatives exist for every 100 to 1,000 people within a localized region, alongside representatives for formal organizations operating within the People's Union.

Within the People's Union, there exists only one hierarchical layer of representatives. This limitation is necessary so that the power of the people does not gradually become the power of the representatives. Therefore, representatives exist to communicate the will of their constituents rather than rule over them. Within a Partacey, policies are addressed

according to the scale of their effect upon society. Councils possess the right to organize coalitions together to address shared issues, provided that a majority of councils within the coalition agree.

Coalitions within the People's Union operate through a horizontal hierarchy, meaning that no singular individual rules over the coalition itself. Coalitions are formed for convenience during moments where collective action is required to solve a shared issue. If a coalition expands to over 100 councils, then the coalition may elect a coalitional representative. However, this representative possesses only ceremonial authority and exists merely to communicate the collective public position of the coalition to the broader People's Union. The coalitional representative acts as a symbolic voice for the coalition while coalition members remain focused on solving the issues they face.

Coalitions are important because they ensure that communication between those directly affected by a problem and those attempting to solve it remains as direct as possible. Within the People's Union, those most affected by an issue are the people most responsible for addressing it. Therefore, councils possess a strong incentive to cooperate with one another and form coalitions because the emotional market rewards mutually respectful participation. Through cooperation, councils gain the productive ability to generate the respect wealth necessary to solve issues within their communities.

Coalitions are like diplomatic alliances for counties. If an autonomous council has a law

within a coalition that conflicts with the values of that coalition, then the council has the full right to leave the coalition or vote to get rid of that law within the specific council. Councils are limited to impacting their constituents, since a council cannot intentionally try to affect another council in a negative way. If a council accidentally affects another constituency, then the affected councils must develop a coalition to solve the problem, or their constituents might suffer through decreased mutual respect generation. Yet, I highly doubt that a loved cultural value will be worth much, if it leads to the impoverishment of that society.

Decentralization and Local Problem Solving

I believe that in the face of cultural angst, the Partacey will still run normally because decentralization addresses the humble concern, and gives rise to answers. The efficiency of decentralized councils is supported by an article from Paul D. Hutchcroft (2001), who states that, “Strategies of decentralization should rest on a solid understanding of the preexisting character of ties between capital and countryside” (42). Councils within a Partacey are ideal for this because they are organized around local communities (countryside) themselves. The people most affected by economic decisions are therefore those who possess the greatest influence over the allocation of capital within their own region.

An example of a problem that a Partacey can solve is a rusting pipe in Flint, Michigan.

The local council would possess a strong incentive to address the issue because respecting the constituents' access to safe water generates mutual respect within the emotional market. Through productive mutual participation toward solving the issue, the council and supporting organizations generate the respect wealth necessary to fund the repair project itself. Projects such as repairing the rusting pipe are funded through voluntary donations and the respect wealth generated by mutually respectful participation toward the project. This creates a "do-now" model of funding, where action comes first and finances stabilize afterward through the generation of mutual respect.

The Head Government does not directly interfere with the fixing of the pipe. Instead, the head representative may publicly address the issue before the nation in order to increase awareness, donations, and participation toward resolving the problem. If the local council cannot generate enough respect wealth or receive enough support to resolve the issue, then the problem naturally expands in scope. Nearby councils become affected by the worsening issue and therefore gain an incentive to assist the struggling council through coalition-building, financial assistance, and productive mutual participation.

One of these methods to help the local council address the issue is allowing the council to join multiple coalitions within a horizontal hierarchy, to maximize their support structure to get things done. This makes sense because communities can share the same problems, given that communities tend to be communal. At this point, most problems have the means to be solved, so failure should be extremely unlikely, given that the project funds

itself, and it has lots of external support at this stage Yet, if the issue grows to the point where it affects the nation as a whole, then the People's Union addresses the issue nationally through direct cooperation between councils, organizations, and coalitions under the symbolic unity of the Head Government. All of which are funded through the Partacey saving up a certain amount of respect wealth to address the issue.

Within the process of solving issues, organizations may also establish coalitions with one another. However, organizational coalitions cannot formally merge with coalitions of the people because this would grant some organizations disproportionate influence over public affairs. Organizations may still donate to public causes and support coalitions of the people voluntarily, solely to serve the mutual respect of society.

Yet, organizational coalitions must not infringe on the higher sovereignty of the councils and their coalitions. Within the People's Union, councils have higher sovereignty than organizations because all members of the organizations are first members of a local council and then members of an organization. Thus, the say of an organization can be overrun by the say of a council. This creates an internal power balance within the People's Union, in which if a single council, with due cause, objects to the entire will of the organizations, then the council wins. This makes sense because all organizational members already have their say in their respective local council they reside in. Thus, coalitions create a decentralized separation of powers by forcing organizations, councils, and citizens to compromise according to the scale of the issue being addressed.

Political Courts and the Separation of Powers

Within a Partacey, power is separated between the Head Government, the coalitions of the People's Union, and the political courts. The Head Government creates national unity through symbolic representation and public communication, while its authority is checked by will of the people. Coalitions address issues at local and national scales while their authority is checked by political courts. All political courts analytically evaluate disputes, laws, and elections according to the constitutional framework of the Partacey. The political courts have their authority indirectly checked by the people who are directly affected by their passed laws. The emotional market stabilizes this separation of powers because institutions that maximize mutual respect become the most economically productive and politically stable. Therefore, power naturally flows toward localized institutions and away from higher hierarchical positions.

The more people a representative claims to represent, the less personal freedom that representative possesses within society. Representatives are therefore not rulers of the people, but subjects of the masses. Representation within a Partacey is not a privilege. It is a sacrifice of individual will for the collective voice.

The political courts of the Partacey are separated into national political courts and local political courts. The singular national political court deals with constitutional disputes,

national elections, inter-coalition conflicts, and national emergencies. Its authority is ultimate throughout all councils unified within the Partacey. Councils directly affected by a national legal issue possess the right to attend court sessions and present their constituents' arguments.

If a two-thirds majority within a council votes in favor of a law change, then the proposal is brought before the local political court within that council's region for debate and analysis. If multiple councils within the same coalition are affected by the issue, then the coalitional representative may formally present their shared position before the court. The national political court evaluates claims, evidence, and reasoning to determine which policies or decisions best reflect the will of the people within the constitutional framework of the Partacey. The court may also call for revotes in situations where electoral deadlock or instability threatens public legitimacy.

National political courts are intentionally slower institutions because they require broader consensus. Local political courts, meanwhile, are faster because they serve smaller populations and require less consensus to resolve issues. Local political courts deal with disputes, elections, and laws within their respective councils. Both local and national courts possess the authority to reject laws if a two-thirds majority of judges determine that the proposal violates the mutually coherent good of the Partacey.

Within a Partacey, systemic disputes within the political courts can be resolved through

the incentives of the emotional market to remain respectful toward others and toward the legal process itself. If those who disagree follow the legal process respectfully, then they will still be financially rewarded through their generation of mutual respect towards the legal process, even if they lose the legal case. The respect wealth gained through respectful participation can then be used to solve the issue to the best degree physically possible, reducing the incentive for destructive political conflict within society. Yet, since I value the utmost importance of the emphasis on the people living on the ground who cannot be rebuilt, the importance should not lie within the nation as a whole that can be rebuilt. Therefore, local political courts are reserved the right to domestically protect their communities from perceived political and economic threats, under the constitution of the Partacey they reside within.

All of the political courts possess unelected judges because judges must remain analytically objective and insulated from the temporary passions of any singular group. Judges are selected professionally by a small elected bureau of four to five hiring officials. If a two-thirds majority of these officials agree upon a judicial candidate, then the judge is appointed. On the other side of the court, rests those that are able to bring issues to the political courts. These actors are the coalitions of councils, a singular council, or individual citizens. Organizations cannot legally bring issues to political courts because that would double the representative power of some over others, which is unacceptable. The political courts are therefore necessary to transform the proposals of the masses into coherent and organized policies that can objectively maximize mutual

respect throughout society.

Within a Partacey, most laws will be incentivized to be mutual laws that affect all councils that are within the Partacey, unless special issues are addressed and are needed to be taken into account within the law-making process. If a local political court develops a law that challenges the mutual law of the national political court, then the number of councils that are directly affected by the localized law are able to revote to change that law. If compromise between local and national law becomes difficult, then a temporary "board of peace" may be established between the will of the Partacey and the will of those affected by this legal disagreement. I can imagine that the most likely outcome of this compromise process would be increased autonomy for those councils that disagree with the mutual law, to implement their own localized laws within their own councils, with special exceptions based on the aggregate mutual respect of the Partacey.

The emotional market organizes power to flow towards the people and flows power away from higher hierarchical positions, since it is harder to have everyone agree with you that what you are doing is mutually respectful when there are more people within a group. Therefore, the power rests within the people and the councils, since they can maximize their mutual respect for each other by being the most localized unit of the government.

Representation and Elections

Henceforth, the need for representatives within the People's Union is very important because it maintains order for the localized units of the government, not through force, but through mutual self-sacrificial respect. Within the People's Union, representatives are required to obey the expressed wishes of their constituents to the highest degree physically possible. If a representative fails in this responsibility, then the constituents possess the right at any time to call for a vote on whether that representative should remain in office. Representatives within the People's Union serve part-time rather than full-time. This is necessary because a Partacey requires the majority of its population to remain actively engaged within the emotional market through labor, creativity, education, agriculture, industry, and public participation.

If representatives were full-time, then they would be less knowledgeable about the communities that they serve, which will make them less effective at their job. Also, the possible labor pool would be reduced, due to the vast amounts of representatives that would need to be in office. Representatives therefore function similarly to members of a civic organization rather than a permanent political class. Their authority exists only while actively serving their constituency, so that the person within the representative can get some rest from the intense emotional labor of their role.

The voting method used within a Partacey is inspired by ranked choice voting through the Borda Count principle, seeking outcomes that approach a two-thirds majority consensus. The viability of the Borda Count system is supported by Donald G. Saari (1985), who

states, “Our unrealistic dream was to find a procedure which always yields a transitive ordering; a more realistic objective is to find those voting techniques which minimizes the damage to consistency. We will show that for voting methods, the Borda Count is the unique answer” (2).

If five candidates are running for office within a constituency, the election process may begin as follows:

Candidate One: 20% of the vote.

Candidate Two: 10% of the vote.

Candidate Three: 30% of the vote.

Candidate Four: 15% of the vote.

Candidate Five: 25% of the vote.

Once the votes are done being counted, the candidate in 5th place within the 1st round of voting will get zero points within the election, then the candidate in 4th place will get one point. Then, the candidate in 3rd place will get two points, then the candidate in 2nd place will get three points, and finally, the candidate in 1st place will get four points. Therefore, after the voting round is finished, the loser of the vote will be dropped from the ballot; in this case Candidate Two will become disqualified. After this, those that voted for Candidate Two’s share of the vote will then revote with the remaining choices of candidates. The second round may appear as follows:

Candidate One: 21% of the vote.

Candidate Three: 31% of the vote.

Candidate: Four: 20% of the vote.

Candidate Five: 28% of the vote.

The process repeats:

Candidate One: 22% of the vote.

Candidate Three: 41% of the vote.

Candidate Five: 37% of the vote.

Finally:

Candidate Three: 48% of the vote.

Candidate Five: 52% of the vote.

Therefore, Candidate Five won the office of representative for this constituency with 52% approval of the population. Under a winner-takes-all system, Candidate Three would have initially won with only 31% support. Ranked choice voting instead allows broader public input throughout the election process, producing outcomes that better reflect collective consensus. Therefore, if a Partaceyist society is serious about upholding

democracy and decentralized governance, the Partaceyist society should govern its elections under the ranked choice model of voting for all decisions to standardize this process into Partaceyist societies.

Organizations and the Economic Reserve

Within a Partacey, all organizations operating within the People's Union are democratically organized communes controlled by the workers participating within those organizations. Partaceyists support communes because they are the closest institutional form to an organization ruled collectively by all active participants. Within the emotional market, collectively organized institutions are also the most economically productive because they maximize the generation of mutual respect across the organization.

Organizations within the People's Union include bureaus of public works and Partaceyist businesses. Public works organizations include transportation, infrastructure, healthcare, education, political courts, and other services necessary for society. These organizations also possess ceremonial organizers or head representatives whose purpose is to publicly represent the concerns and goals of the workers themselves. Similar to the Head Government, these organizational leaders possess symbolic authority rather than ruling authority. Within a Partacey, positions such as bureaucrat or CEO are not offices of domination, but offices of submission to those being represented.

For example, the Bureau of the Collective Rise organizes and redistributes pay to citizens throughout the Partacey. Its sister institution, the Bureau of Love Prices, records public opinions regarding goods and services and verifies these opinions within the emotional market through Artificial Intelligence systems. The Bureau of Love Prices also maintains a secure application that allows citizens to submit opinions regarding products and services. Environmental and social scores are then applied to products according to their broader impact upon society and nature.

If every rating of a product were a perfect 10 out of 10, such a rating would be considered dishonest because no product is perfectly mutually respectful under all conditions. Therefore, products receive social and environmental adjustments based upon their wider effects on society, regardless of how genuine an opinion sent is.

The only major public institution that does not formally operate within the People's Union is the economic reserve of the Partacey. This separation exists because if elected officials directly controlled the national reserve and monetary system, then the reserve could be manipulated for short-term political gain rather than the long-term common good. Yet, workers within the economic reserve still remain citizens within the People's Union and receive payment from the collective rise. However, workers within the reserve are required to swear an oath to protect the stability of the Partacey's economic system and preserve confidential financial information. If they disregard this oath, they will not only lose their job, but be barred from being hired into the economic reserve of the

Partacey, and hurt the current distribution of pay within the collective rise for everyone, including themselves.

The economic reserve manages the stability of the emotional currency through reserve management, emergency lending, and interest rate stabilization. Within a Partacey, interest rates are set by the reserve, but function out in the emotional market in accordance to the aggregate generation of mutual respect. As mutual respect increases across society, prices decrease and interest rates fall, allowing more productive investment to occur. However, investment can become excessive. When institutions become overinvested, disrespect increases because society begins perceiving the imbalance as wasteful or unstable.

To imagine how an institution can become overinvested, imagine that a person hugs you a few times. The action feels respectful. Yet if that same person hugs you 100 times in a row, the action eventually becomes uncomfortable and frightening. Likewise, excessive investment beyond what is socially necessary increases disrespect within the emotional market and causes interest rates to rise. Eventually people will stop investing in the stock, which slows down the growth of the stock. This is when the institution will start to recover, via society seeing the institution as being more fair, which increases the generation of mutual respect, which increases the pay for all within the Partacey.

Thus, de-investing overly invested assets like housing makes investing in the institution

more profitable, since balance is more mutually respectful than abundance. Interest rates are designed like this to retain an equitable distribution of wealth amongst the Partaceyist society. Within investing, value comes not from the static price of the investment itself, but from the mutual respect generated by the institution as an asset. Donations are different from investments because donations do not have fixed rates onto them; the growth rate of a donation is determined by the emotional market, it is not settled by the economic reserve of the Partacey.

The larger an investment becomes, the greater the possibility that parts of the investment become unnecessary or excessive. Meanwhile, the larger a donation becomes, the more mutual respect it can generate throughout society. One is not scared of extremely large donations, since donations are understood as contributions made from the heart rather than obligations driven by expectation. Therefore, the uncertainty of the exact purpose of the investment to everyone makes investments prone to kick you back, if you rely on them too much in a Partacey.

The economic reserve may also provide financial recommendations to organizations and institutions within the People's Union. However, the reserve cannot directly force implementation because it exists outside the People's Union, in order to maintain its mutually respectful transparency. An example of a financial regulation tip that the economic reserve of the Partacey can give to the Partaceyist governance is what ranking will be best to reflect the given economic transaction being addressed. So, if a customer

wanted to buy a car and another customer wanted to buy an apple, then the economic reserve of the Partacey will inform the necessary organizations that the car should be valued in a ranking of 1 to 1,000 and the apple should be valued in a ranking of 1 to 10, to standardize the perceived value of those items. If organizations ignore economically stabilizing recommendations, then the Bureau of Love Prices may lower the organization's social score for acting against the stability of the emotional currency. The economic reserve additionally serves as the lender of last resort during periods of increased disrespectfulness within the emotional market.

The reserve is funded through donations, respect wealth generation, institutional commission partnerships, and broader productive participation throughout the economy. An example of the economic reserve of the Partacey handling a theoretical emotional market recession is the reserve funding food banks, mutual aid programs, and environmental restoration. This can produce mutual respect, but instead of printing money out of thin air, the mutual respect is tied to action. This naturally limits the production of mutual respect directly to actions that are the building blocks of the economy. Henceforth, recession induced stagflation should not be a problem within a Partacey.

Taxation and the Flow of Power

Within a Partacey, traditional taxation largely becomes unnecessary because the

government itself participates within the emotional market. Instead of relying primarily upon coercive taxation, institutions generate wealth through productive mutual participation, which generates mutual respect. The most mutually respectful organizations may voluntarily contribute portions of their generated respect wealth toward the economic reserve of the Partacey in exchange for economic cooperation and long-term stabilization. These payments are not taxes in the traditional sense because participation remains voluntary, focused on the largest producers, and functions more similarly to institutional commission agreements or donations.

Why would organizations willingly contribute to the reserve?

It is because mutually respecting the stability of society and the broader economy becomes economically profitable within the emotional market itself. Therefore, the government gains greater productivity by investing in the generation of mutual respect through direct action rather than by coercively extracting wealth through taxation. Henceforth, within a Partacey taxes are not guaranteed, since everyone within the government, so to tax the population is to effectively tax yourself to fund your life, which is just plain stupid. Therefore, within Partaceyist societies taxes are deemed irrelevant.

In essence, the Partaceyist system of governance emphasizes that power is not defined by control, but by responsibility. Those who represent larger numbers of people possess less personal freedom because they become increasingly bound to the collective will of the

population they represent. Thus, the politicians of a Partacey are not rulers of society, but the servants and subjects of the masses. Power within a Partacey flows downward toward the people, councils, organizations, and local communities because those localized institutions are best capable of maximizing mutual respect between human beings.

The emotional market therefore organizes society away from rigid hierarchy and toward decentralized participation, accountability, and productive cooperation. Representation within a Partacey is not a ladder of domination. It is a network of responsibility.

Chapter 4

Partaceyist Law and Order

Some may say that if taxes can be deemed disrespectful, and hence unprofitable endeavors, then what about law and order? Surely the police will need funding to continue their operations, right? Yes, but it is not taxes. Taxes are simply dead, plain and simple. The masses have long said that nothing is guaranteed but death and taxes, and now taxes are gone.

The Partaceyist police will be the organization that requires the most donations to remain operational, precisely because they cannot rely on generated mutual respect in the same way as other institutions. The police fund, derived from voluntary donations, is specifically allocated to address regions of high crime and low trust in law enforcement, so that the Partacey can be balanced in its policing. This is due to the violence inherent in law enforcement. Law enforcement is a non-mutual action between the enforcer and the offender, and therefore does not generate mutual respect during its execution. This places the Partaceyist police in a dilemma: Should the police do their job and lose respect wealth because of it, or should certain forms of violence be redefined as mutually respectful

when they serve the Partacey?

Partaceyism accepts neither option.

Instead, it introduces a third path: when pursuing an active threat against society, the Partaceyist police are temporarily removed from the full emotional market. During this period, their actions are not evaluated through mutual respect generation, because the situation itself is inherently non-mutual. To sustain law enforcement, the Partaceyist police are funded through a donation-based institutional pool, supported by citizens and organizations who value stability and safety within the Partacey.

However, the police are not entirely disconnected from the emotional market. When they are not pursuing active threats, their duties, such as monitoring for safety, training, and maintaining protocols, are mutual in nature. These actions generate mutual respect, which contributes to the collective rise. In this way, the long-term financial well-being of law-abiding officers is sustained not by acts of coercion, but by their consistent participation in mutual service.

There is also a deeper dynamic at play. When citizens donate to the police, and the police risk their lives to protect those citizens, both sides perceive a high degree of mutual respect. The citizen values the stability provided, and the officer embodies that protection. This relationship generates significant mutual respect, which flows into the

collective rise and ultimately returns to both the donors and the officers. In this sense, the funding of police becomes not an obligation, but a shared affirmation of societal stability.

Limited Exposure and Accountability

To ensure fairness and prevent abuse, Partaceyist police officers operating outside the emotional market must be constrained by limited exposure windows. These windows are defined not by arbitrary time limits, but by operational necessity and are subject to review. If a pursuit extends beyond what is reasonable, other officers may take over, ensuring that no individual remains outside the emotional market longer than necessary. This prevents prolonged detachment from accountability while maintaining effectiveness in real situations.

This limited exposure window is solely for actively pursuing threats. It does not include contributing to investigations, testimonies, or any non-violence means to assist in the case. Each Partacey defines what counts as a reasonable response to an active threat based on its local cultural and physical conditions. Officers are presumed to act reasonably unless there is strong evidence otherwise.

Accountability is central to the Partaceyist law enforcement. While an officer is pursuing an active threat, their actions are not rewarded through direct mutual respect. Yet, they are still indirectly judged. The only actions that are evaluated are those that are

unnecessarily disrespectful relative to the threat at hand. To enforce this, a partially parallel system operates alongside the emotional market during these moments.

When the officer returns to the emotional market, their actions while outside of it are assessed by an external bureau, associated with the local political court where the action took place. A bureau that is specialized in cases like these, and analyzes these cases not based on intent alone, but on both their short-term and long-term consequences. If these consequences are unclear, then the bureau would likely look at the accumulated directly related effects of such an action a month after it took place, yet the process can take longer, if need be.

If the consequences are extremely clear or permanent, then the external bureau can make a decision immediately. If an officer uses excessive or unjustified violence, they incur a great cost. They receive a bill issued by the Bureau of Love Prices, which is scaled to the severity of their actions. This cost represents a form of disrespect debt that must be repaid, akin to a student loan, before the officer can re-enter the duty of law enforcement. If the violation is extreme, such as killing without justification of self-defense, then the response escalates beyond a bill. The officer is removed from their position and sent to court, where they are treated no differently than any other individual who has committed a crime.

Through this structure, Partaceyism does not attempt to justify violence as mutual, nor

does it allow it to operate freely without consequence. Instead, it contains violence, limits its scope, and subjects it to a system of post-action accountability, since that is what is most manageable for the legal system of the Partacey. The emotional market remains intact, while necessary coercion is carefully isolated and controlled. At the same time, the broader system works to reduce the need for such coercion altogether. Crime, within the Partacey, becomes economically inefficient, because crime is inherently disrespectful. Crime leads to higher costs, lower trust, and reduced participation in the emotional market. Black market goods and stolen items become more expensive and less desirable compared to mutually respectful alternatives. In this way, the emotional market itself acts as the primary deterrent to crime, while the police serve as a secondary safeguard when that deterrence fails.

In the land after taxes, law and order exist through voluntary support, constrained force, and a system that rewards mutual respect while holding non-mutual actions fully accountable. Within such a system, prisons as they currently stand become unprofitable, and therefore must be radically transformed.

Redemptive Justice and the Prison System

Punishment-based prisons, like those in the United States, have higher recidivism rates than systems focused on redemption, such as those in Sweden. This is supported by Josefin Hedstrom (2018), who states, “Not only does the United States have a serious

prison-overcrowding problem, but their recidivism rates are extremely high as well. About two thirds of offenders return to prison within three years of their release. Since the early 2000's, Sweden's reentry rate has dropped by almost 10 percent, and in 2011, only 31 percent of offenders committed another crime within a 3-year period after their release" (6).

This evidence reveals more than a moral preference, it exposes a structural advantage. Redemptive prisons reduce recidivism, and reduced recidivism lowers long-term crime rates. As crime decreases, the emotional market stabilizes, since fewer disrespect-based actions circulate within society. Thus, redemption is not only more humane, but more economically and socially efficient.

Accordingly, the justice system of the Partacey must be structured to facilitate redemption at every level, beginning with convict courts. Convict courts deal with those who have committed crimes and are structured similarly to district courts in the United States of America. Judges are unelected, determined by professionalism, and must have no personal connection to the case at hand. Juries are composed of individuals with no personal or professional ties to the accused.

These non-partial judges are funded through investments and voluntary contributions while on duty, and the judges in political courts could share the same system. This can ensure that judges remain objective and unbiased while still being compensated, similar

to how Partaceyist police officers are supported during active pursuits. Also, within convict courts, verdicts are reached collaboratively. A two-thirds majority of the jury, supported by the judge, is required to decide a trial. This structure balances democratic input with professional oversight, producing decisions that are both stable and legitimate.

Redemptive justice also fundamentally redefines the purpose and function of bail. The emotional market shifts bail away from material payment and toward conduct. Bail is granted when an individual generates sufficient mutual respect to meet a defined threshold of social trust. This threshold is evaluated based on conduct during proceedings and prior behavioral patterns. In this way, release is not purchased, instead it is earned. I love this new form of bail because it removes the current imbalance where wealth can override accountability and replaces it with a system rooted in perceived fairness.

Sentencing Beyond Time Alone

Yet, the deeper transformation lies in sentencing itself.

Within a Partaceyist society, convict courts establish a proportional accountability period. I do not think that convict courts should simply assign a fixed amount of time and then release someone once that time has passed, because time by itself does not tell us whether someone has changed. Time-based sentencing confines justice to material measurement. This happens when time becomes the only thing that determines freedom. A person can

spend ten years in prison and remain the same person they were when they entered.

However, I also do not believe that a person should remain imprisoned indefinitely until a tribunal believes that they have changed. No institution can perfectly know what is happening within another person's mind. A tribunal cannot simply look at someone and say that they know whether the person genuinely has developed an ought to do what is right. This would create another form of unfairness, because someone could remain in prison simply because other people are unconvinced of their internal transformation.

This is why a Partaceyist society should use a proportional accountability period. The period of accountability is proportional to the crime and the harm that was caused. This establishes the boundaries of justice. A person who commits a greater harm should have a greater period of accountability, while a person who commits a smaller harm should not have their entire life determined by it. This prevents arbitrary sentences, but it also prevents the justice system from imprisoning someone forever because they cannot prove that they have changed.

Yet, time is still not redemption. One can use time to measure containment, but it cannot produce the will to be good from that containment.

During this proportional accountability period, the purpose of prison is to create the conditions for redemption. Without the development of the convict’s internal will, release

becomes a return to the same conditions that produced the crime. At the same time, the convict court cannot directly measure someone's internal will, since it is not a collective score that becomes objective, it is singular, or subjective. What the convict court can see is how their sentence will begin to affect the person's actions.

When a person develops an ought to do something, I think that this eventually becomes visible through the way that they act. It can be seen through their actions, relationships, decisions, and responses to other people. I have seen this myself, while working with former convicts, serving food to other people, happier than I ever hope to become myself. When someone genuinely wants to do something, there is a difference between them simply being forced to do it and them actually wanting to do it. However, no single mannerism should determine whether someone has changed. People act differently, and someone could also learn to perform whatever behavior the tribunal of the convict court expects from them.

Instead, the tribunal should look at the individual over time. Redemption is demonstrated through behavioral stability, participation in communal structures, and the consistent ability to engage in mutually respectful interactions without supervision. It can also be seen when an individual is given increasing levels of freedom. For instance, if someone only acts respectfully when they are being watched, then their observed respect has not yet become their own will.

The ultimate purpose is not to make the convict believe whatever the government wants them to believe. They do not have to become a Partaceyist. The purpose is for the individual to develop the willingness and ability to live within society without violating the mutual respect of others. In this way, the proportional accountability period establishes the boundaries of justice, while redemption determines what the individual does within those boundaries.

Some may argue that this removes deterrence. Their position is supported by Frank Bean et al., (1971), who states, “Analysis of covariance procedures demonstrated (a) that the deterrence hypothesis does not need to be modified when regional differences are taken into account; (b) that severity and certainty of punishment maintain a significant, inverse relation with homicide rate that is independent of regional effects” (289). This suggests that increased severity reduces crime. Yet, American Sociologist, Jack P. Gibbs et al., (1986), challenges the foundation of this assumption, stating, “Observe that the notion does not specify ‘how’ the relations observed in this research are produced. Certainly, it would strain credulity to assume that the citizenry has an accurate idea of the certainty and severity of imprisonment for criminal homicide; but the notion of deterrence has never been formulated in such a way that a more plausible assumption can be articulated” (530).

Jack P. Gibbs is stating here that deterrence does not function through actual severity, but through perceived legitimacy. At best, severity suppresses behavior externally, but it does

not reshape the internal will that generates that behavior. A system that is not perceived as fair will not produce stable compliance, regardless of how severe its punishments are. What matters is not the punishment itself, but how people interpret the system enforcing it. Under punishment-based systems, this interpretation becomes distorted. Individuals begin to operate within an individualized interpretation of Respect, in which they develop a personalized defensive framework shaped by coercion, where survival and dominance replace cooperation. When punishment is enforced through time and authority alone, the individual does not internalize the mutual good, but instead resists it.

This is why time-based sentencing reinforces the very behavior it attempts to eliminate when time becomes the sole purpose of imprisonment. It confines justice to a material countdown, while leaving the internal conditions of the individual unchanged. The result is not transformation, but containment. Yet, I also cannot allow the opposite to happen, where someone remains imprisoned indefinitely because a tribunal does not believe that they have changed enough.

A proportional accountability period solves both problems. The period establishes how seriously society views the harm that was committed, while redemption gives the prison system something to actually work toward. The individual is not simply waiting for a number of years to pass, but neither are they waiting forever for other people to determine whether their soul has changed.

For example, for minor offenses a sentence could be one to eight months. A serious theft could be a sentence of eight months to two years, and violent conduct could be a sentence of two years to six years. The ranges are what matters, since the convict can gain the possibility to grow on their personal terms, so that they are more personally involved within the moral community of the Partacey.

What I propose here is that a rule of law based on mutual respect operates differently. It creates the conditions for individuals to willingly realign with the mutually coherent good. If a person feels forced to change under threat, they resist. True change occurs only when the individual chooses alignment with the mutual good as their own will, rather than as a response to external pressure. If they are given the structure to understand and participate, they adapt.

Under a punishment-based prison, all that convicts are left with is an individualized interpretation of Respect, shaped by their treatment within the system and the misalignment between themselves and law enforcement. This creates an illusion of peace. While severity may reduce visible crime, it does so by suppressing behavior rather than resolving it. Yes, it is true that as the homicide rate decreases the severity of the punishment increases, which saves lives, but breaks those lives in the process. This reveals the inefficiency of individualized respect when it comes to producing long-term stability for our communities.

Redemption as the Core of Justice

Violence, therefore, must be minimized and never be the defining structure of prisons, because violent systems produce violent people. Within the Partacey, redemption becomes the central priority of the justice system. This is because redemption, facilitated by the mutual respect of law enforcers toward convicts, can cultivate a will within each convict to follow the example of mutual cooperation rather than the violence of prison. Punishment itself is transformed. It becomes a mutual process of change rather than an imposed experience of suffering. The most effective way to change someone is to show them what they have been missing out on, not to force them into submission. My parents punish me by showing me what will happen if I continue down my road, which changes my behavior without any physical coercion necessary, because the effect is not isolated, it expands like a virus that must be contained.

This is where existing systems fail. The United States of America upholds ideals of fairness and equality under the law, reflecting mutual respect in theory. However, the reality of violent prison conditions creates insecurity and isolation. This pushes individuals back into individualized respect, where power, control, and survival dominate. In this environment, even destructive behaviors, such as gang culture, begin to appear rational.

Redemptive prisons reverse this process. They transform prisons from environments of

individualized respect into environments of mutual respect. This requires structure, not just being more merciful or tolerant. We need prisoners to have TVs, books, games, gyms, communities, limited freedom, care, compassion, friends, hope, and education. These are not luxuries, they are necessary conditions for transformation. These luxuries exist not to control behavior, but to cultivate the internal will necessary for individuals to sustain mutual respect beyond the prison environment, and become the standard for us all.

If prisons do not have the joys of life, then joy will find another way, filtered through the personal experience of the convict, which tends to be filled with chaos within prison. Therefore, prisoners become chaotic because we deprive them of humane treatment. If prisons are structured around stability and cooperation, individuals will begin to reflect those conditions. And when individuals operate within stable, connected communities, crime decreases. Lower crime rates stabilize the emotional market by reducing the presence of disrespect-based activity.

Partaceyism sustains this model through a feedback loop. The mutual respect generated within redemptive institutions feeds back into the funds of the prison, funding further transformation and reinforcing stability. Justice becomes self-sustaining. Ultimately, the deterrent is no longer fear of punishment, but the cost of falling out of alignment. Individuals do not want to return to prison, not because of suffering, but because of what it represents. To return is to admit disconnection from the mutually coherent good, which

damages both their reputation and economic standing within the Partacey.

People will go once to get out, and they will not return, because their willingness will no longer align with what led them there.

Chapter 5

Partaceyist Education and Healthcare

I have stated that prisoners need education within prisons, and I mean it. Let's look at how education is executed within a Partacey. Education is very important in the development of society. Yet, there are some serious issues of education that no one is talking about. As someone who has experienced both public and private schooling, I attest that we can do better.

Partaceyist education is based on the idea that education is like eating a cake. In the Cake of Education, the bottom refers to foundational concepts and procedural building blocks, while the top refers to higher-order conceptual frameworks and abstract synthesis. Learners may enter at any layer, and education does not require strictly linear progression. However, these different pathways serve different purposes towards the same end: bottom-up learning is perceived as faster, but makes a mind full of technical rigor that is hard to translate back to the masses, while top-down engagement is slower, but strengthens intuition and holistic conceptual understanding. This framework is therefore not a collection of separate entry points, but a single unified structure in which

all layers are interconnected, and any point of entry ultimately leads into the same whole system of understanding. All entry points are possible, though not equally efficient across different learners or contexts.

Importantly, I must add that my view of top-down and bottom-up are not prescriptions of order, but descriptions of learning emphasis. The cake does not collapse from where one begins; rather, difficulty arises when a learner lacks the conceptual support needed to connect layers. With support, any entry point can become stable and meaningful. Yet, I desire the path where support is needed the least.

The best way to productively eat a cake is to eat the cake from the top and not the bottom. Why is this the case? It is because if someone had eaten the cake from the bottom without understanding its structure, then the cake would collapse. Yet, what falls is not the direction of learning being undertaken, but the failure of the student to conceptually understand the full Cake of Education in the long-term. I view the collapse of the cake as the moment when people get lost in a subject material and feel like all hope is lost.

You cannot eat the beginning material of a subject and expect the journey to the top of the cake to be easy. The current structure of the educational cake framework is designed to collapse onto you only when learning is disconnected from conceptual support and meaning-making. So, why not just eat the cake from the top? If eating the educational cake from the bottom is going to fail you, then innovate and eat that cake from the top!

Kids should be taught to learn the most richly complicated subjects first within schools. This implies that kindergarten schools across the world should be teaching quantum mechanics to kids through conceptual exposure like a fun game, rather than trying to make the kids become masters overnight, like what school currently does.

Knowledge, Community, and Intellectual Access

Smartness is simply based on what you have heard and how you use that knowledge. Many of the barriers we associate with education are social constructions reinforced by institutional hierarchy rather than the absolute limits of human understanding. Human understanding has no set minimalist beginning nor maximalist end, it merely can be entered or exited through will alone! The masses thinking it is an unattainable dream for them to become smart people is a fantasy that everyone has been fooled by for thousands of years. I personally taught myself physics in high school from watching educational YouTube videos from PBS. I first tried to learn physics by going to the bottom of the cake, and I got a D in my Intro to Physics class. So, I decided to take a radical turn to engage more towards the top of the cake, and I applied and got into an Honors Physics class. I got an A in that class and the topics were much more complex than in my Intro to Physics class. Taking a risk, no matter how educated I am, helped me more than staying where I was at.

What my experience in high school has shown me is that strict social barriers around

higher-level knowledge are artificial. No knowledge should be socially forbidden or artificially reserved for another time, no matter what so-called level of education you are in. The social structuring of knowledge plays a more important role in asserting knowledge to others than the learning of that knowledge itself. This is supported by Paul Ashwin (2014), who states that, "They argue that students' accounts of sociological knowledge shift from a very general account of the world to one structured by the curriculum to one that recognizes the partiality of sociology in understanding the world" (125). This quote shows that students cannot learn in a vacuum; they need a good community to be good learners.

If education is shaped primarily through community interaction rather than raw physical ability, then learning cannot be understood as a purely individualized process. In essence, this means that communities do not become higher in understanding on a certain scale because communities are built within the confines of mutual cooperation, which breaks down higher-level structures, like knowledge that others do not have. Therefore, a kid should be able to ascertain higher-level knowledge with a mutually respectful enough community because they receive support in the things they do not know, so they can take the leap to eat from the top of the Cake of Education.

Modern education often focuses too heavily on the isolated brain rather than the social environment surrounding learning. Yet, knowledge functions more like a meal that can begin at many different points rather than a metaphysically ultimate object. Where a

person begins their learning matters, because starting higher can expose them earlier to the truest flavors of knowledge, no matter what age they are. Knowledge is discovered, while the brain wills itself into creation to see that discovery.

I presuppose that elementary schools should be teaching the rich complexities of life, such as attempting to solve the Riemann Hypothesis, learning the nuances of biology, and learning about the greatest philosophers such as Hegel, Nietzsche, and Thomas Aquinas. Elementary schools should not be about exact knowing, but experiencing. Yes, there are basic skills that all kids need to learn at a young age, such as speech, writing, and communication. Yet, all of those things are within the complex knowledge as well. So, instead of telling a kid about such necessities, it will be better to trust in the kids to critically evaluate the complexities and find the necessities within. I see this method developing patience and critical thinking with kids, which is what education needs right now! That is exactly what a well-rounded citizen is! It is a patient, open-minded and friendly person, which this system cultivates in beauty. This does not mean rich complexity replaces fundamentals, but that fundamentals and rich complexity can be encountered together, with understanding gradually stabilizing over time.

As kids advance in the schooling system, the education will get less complex, and experiential learning will become more exact learning. The system will transition with kids full of passion and knowledge and they can use their wealth of knowledge to know certain subjects specifically for the labor force. By the end of high school, students

should return to simple truths like 1 + 1 = 2, not as children memorizing arithmetic, but as mature thinkers understanding the philosophical simplicity underlying knowledge itself.

Within college, ideally everyone should have finished eating the Cake of Education. Therefore, with a satisfactory diverse knowledge of the universe one should be able to find what they enjoy and specialize in that, through direct practical experience in such a field. This is because when you have finished eating the cake, all that is left is the joy and satisfaction from the flavoring of the cake. This flavor of the cake is the satisfaction of knowing a set array of things in a diverse way. By graduation, one should be able to go right into where they want to work, as a fulfilled and intelligent member of society that innovates the workplace, rather than following it.

Innovation and the Purpose of Schooling

If a Partacey is going to allow kindergarteners to learn about string theory and advanced calculus, they cannot be graded on this stuff. In the same way that you would not grade a three-year-old kid on how they eat their cake on their birthday. Therefore, the kindergarteners should be tested by how attentive and mutually respectful they are towards the advanced subject matter. This method would value the kindergartener's interpretation of the subject matter, which can develop the joy of learning within the kindergartener through their own creativity. They do not need to be actually right, but if

they are respectfully engaged in trying to learn the subject, then that is satisfactory for a good grade.

At first, kindergarteners may struggle with advanced concepts, but this struggle is necessary for curiosity to emerge. It is like when a person begins eating from the top of the cake: at first the process is difficult, but once they find an area to dig into, the cake begins disappearing faster and faster. Through the student's exposure to higher-level subjects, students can gradually derive language, mathematics, philosophy, and science from their own engagement with complexity.

How can a kindergartener innovate? Neil DeGrasse Tyson (2011) said it best, "One of the great challenges in life is knowing enough to think you're right but not enough to know you're wrong" (1). This is the golden zone where Partaceyist schools should strive to be. Partaceyist schools should strive for balance, because if students learn too rigidly, they stop questioning what they are taught. Meanwhile, if the kids learn too little, they would never truly grasp the full beautiful flavor of the Cake of Education.

Although, if the kids learn by valid rational interpretations and mutual respect for their subjects' materials, then they can hit the golden zone of innovative thinking: thinking they are right but not knowing if they are wrong. A state of non-ignorant confidence that is able to be flexibly changed with the new evidence that comes by. Partaceyist schools should be centers of innovation, and I hope that with patience and humbleness within our

education system we can restore the joy of learning within education once again.

For now, kindergarteners do not understand these topics because teachers are making the kindergarteners focus within class and hoping that they magically learn from their staring at the board. They won't! Kindergarteners need to feel free to learn in their own way and by their own interpretations, so that they can grow and reach the golden zone of innovation. We need dedicated times where students diffuse from class and think on their own, through kindergarten to high school. This can help students feel secure and free to take their first steps in their marvelous dining of the Cake of Education.

Educational Transition and Institutional Support

Yet, the Cake of Education creates limits within society. When the educational system changes, the students that were on their journey of learning beyond kindergarten will need to continue learning from the bottom to the top. This is needed because if someone were to start eating in the middle of the Cake of Education and they get far enough that their educational foundation on top collapses in on itself, then where would their proper educational foundation even be? The students would have no idea where the top is, since they are fully in a very cakey mess.

So, how do people normally solve this? They solve this by dealing with the mess and just start eating the shattered cakey mess of their own education. At this point, there is no

turning back; the cake has already fallen. It will just be better to continue eating, as closely from top-to-bottom as the student can, so at least the knowledge can still be learned effectively. This mess will need institutions to give support to the students in their tough journey ahead. This is because kids are not mature enough to know which parts of the cake are the top or bottom. Therefore, we need to treat kids with mutual respect as intellectuals that need support to see the top of the Cake of Education. When the connection between layers is disrupted, learners are no longer guided by the cake's sequence, but must reassemble their own path through their relation to the Cake of Education that they already know.

Innovation Scores and Educational Oversight

However, if Partaceyist schools are to prioritize creativity and mutual respect, then society must still possess methods to evaluate whether schools are succeeding in those goals. Within this framework, the Partaceyist schools will need oversight to make sure that the Partaceyist schools are becoming efficient at their job. Therefore, within each Partaceyist school, each class will get a required innovation evaluation, based on the similarity of the students' opinions between the mutual respect of class and subject materials of the class.

Innovation scores are not designed to perfectly quantify creativity or truth, but to provide institutions with an approximate indicator of how actively students engage interpretively

with educational material. This educational system can be established by having the Bureau of Love Prices establish a department for each council region, or Partaceyist schools that serve multiple council regions. This department can specialize in dealing with the opinions, or rankings of 1 through 10, of a single school, so that these opinions can be analyzed efficiently and fairly. Therefore, the more similar the opinions of the students are within a class, the lower the social score that is assigned to the class will be. This would harm the funding of the Partaceyist school, but it will not harm the funding in its entirety, since the bureau can only have one score per class. The more students per class, then the less power the score has, while mutual respect towards the subject's purpose should still be prioritized, since that is what distinguishes the uniformity of math and the diversity of the humanities.

Therefore, if a school had four kids in a class and they had innovation scores of 5/10, 5/10, 6/10, 5/10, with ten being the most innovative answer, in the view of the teacher, and one being the teacher's answer in the exact way he/she taught the subject matter. Innovation scores and mutual respect generation are different, so the teacher is paid not by how innovative the students are, but by how mutually respectful the classroom is to the subject and participants. Once the data is recorded, the Bureau of Love Prices would also be required to evaluate the reliability of the classroom data itself. This would allow the bureau to fact-check the evaluations for unnecessary statistical bias, manipulation, or unfair teacher influence before assigning its own evaluative score upon the classroom. Therefore, if the bureau concluded that the classroom itself possessed a social score of

4/10.

Therefore, it can be concluded that the overall score for the class will be 5 + 5 + 5 + 6 + 5 + 4 equals 25. Since the innovation range is out of 10, and there are four students and one social score, the maximum possible student score would be 10 multiplied by 5, which equals 50. Therefore, 25 divided by 50 equals an 0.50 aggregate innovation score for the entire class. Henceforth, it can be concluded that the classroom has not surpassed the minimum innovation threshold, and therefore the school should not prioritize the class as a productive center of creative educational development within the Partaceyist educational framework.

This new grading system is philosophically important because the goal of Partaceyist education is not to force students into perfectly identical answers, but to encourage mutually respectful engagement with the subject material through interpretation, creativity, and rational risk-taking. Therefore, classrooms that generate higher innovation scores would also cultivate deeper engagement with learning itself, since students are actively participating within the subject matter rather than merely repeating it. The innovation score is not meant to replace educational quality, but to measure how alive the educational environment truly is within the classroom.

Hence, Partaceyist schools will be focused on having students experientially learn because when students mutually respect the subject materials, by investing their time and

creativity into the subject at hand, then the Partaceyist school contributes more towards the collective rise. This contributes greater respect wealth toward the surrounding community, allowing more people to donate and invest into the school itself. As the educational environment improves, the school becomes increasingly capable of addressing the intellectual needs of its students.

Partafaire and Healthcare Within the Emotional Market

When the Partaceyist schools are well funded, the Partaceyist society can become healthier and more productive in its aspirations to maximize mutual respect for all. Yet, education alone cannot sustain a healthy society without institutions that preserve the physical well-being of the population itself. This can be no better done than by giving the Partaceyist society a robust healthcare system. Within the Partaceyist society, there will be a system called Partafaire, which is healthcare under the guidelines of the emotional market. Partafaire is influenced by the Singaporean model for healthcare.

For instance, within a Partafairist healthcare system there is a limit to the amount of wealth from the Partafaire fund that each patient can receive. This is due to the Partafaire fund being a centralized hospital fund sustained through donations and investments, which means Partafaire may only be able to partially cover the costs of healthcare. This will not increase inflation because this wealth remains within the hospital system until it needs to be used, which removes the price from the economy when aid is given.

Hence, the necessary resources will still be given to patients, so that the patient can maximize their generation of mutual respect toward the hospital through their direct actions. This mutual respect generation can partially cover the costs of healthcare through increasing the overall wealth within the collective rise. This then increases the wealth of all citizens of the nation, including doctors and patients.

The Partaceyist health care system also incentivizes people to donate to hospitals, since it benefits both the hospital and the patients, given that donating to hospitals is mutually respectful to everyone within society. To make the system more efficient, the partial cover of healthcare costs is not based on income, but on the ranked room that the patient or the family of the patient decides to stay within. This ranked room system is important because the higher the rank of the room, the more luxuries and non-essential elements of comfort that room contains. Meanwhile, the lower ranked rooms reduce luxuries while still maintaining the same necessary medical treatment throughout all ranked rooms. This can decrease waiting times because rooms with greater luxuries will receive less Partafaire aid than rooms without luxuries, since luxury rooms extend non-essential costs to the hospital.

Ranked Rooms and Flexible Healthcare Aid

Yet, those that can afford luxuries might still heavily desire luxuries, even if the costs are

higher, which naturally separates wealthier patients from the waiting times associated with lower ranked rooms. This psychology of people with luxuries is supported by psychologist Robert H. Frank (1999), who stated that, “It’s was Veblen’s view, in other words, that the rich often spent lavishly merely to demonstrate to others that they can afford to do so” (14). This psychology is also present at lesser levels within portions of the middle class, which can incentivize financially stable patients to choose rooms ranked in the middle of the hospital system. Although, the lower ranked rooms, like the 5th ranked rooms, should possess the greatest number of available rooms within the hospital to guarantee that patients can always access a room affordable for them to stay within.

In practice, this can be done by removing luxuries from vacant higher ranked rooms and converting them into lower ranked rooms to increase affordable healthcare to the poorest within society. Healthcare institutions will do this because they need to respect the patient, and this will make the patient respect the hospital. Therefore, this creates a flexible system of room rankings based on the number of people within the hospital at a given time, not based upon an amoral demand, but upon a mutual respect-based demand. This ranked room system can look something like the figure below, although the exact rates should be decided by the local councils directly affected by the hospital.

1st Room □ ~0.1%

2nd Room □ ~10%

3rd Room □ ~40%

4th Room □ ~80%

5th Room □ ~100%

Each square represents a ranked type of room, although the number of rooms can be any amount the Partaceyist nation desires. The percentage represents the amount the Partafaire fund will cover for each ranked room. The poorest people will likely choose the rooms with the greatest amount of Partafaire aid. The costs for these rooms are lower because the rooms lack luxuries like games, televisions, video games, and other non-essential comforts. Meanwhile, the 2nd, 3rd, and 4th ranked rooms justify their lower Partafaire aid because they are designed more toward upper middle class and financially stable patients.

Although, all income-based classes are free to choose whichever ranked room they desire. This is done because welfare based on one's income is inefficient, since all incomes are spent differently. Some people spend more than others regardless of income, because the life of an individual tends to be valued more than their own savings. Thus, different people may possess larger incomes than others, yet still suffer heavily under medical bills simply because their lifeline is more expensive than their income can comfortably sustain.

Partaceyism wants to transcend income and move toward freedom from your income. Incomes should never define anyone, since to be defined by your income is to be trapped

within a state of individualizing your own definition of what is respectful toward others through greed and envy. Some may state that this ranked room system sounds elitist. Although, it is purposely designed to promote freedom above elitism, freedom above your income in a sustainable way.

The first ranked rooms are designed for the wealthiest members of society, but as a result they receive less Partafaire aid to help pay for their medical expenses. The decrease of Partafaire aid as room rankings increase is designed to make resources be spent more proactively, so that donations and investments toward the hospital can make a greater difference toward patients' well-being. Ideally, the lowest ranked rooms should become fully paid healthcare, or essentially free healthcare, funded through donations, investments, and redistributed aid within the Partafaire system itself.

Also, when people invest or donate toward the Partafaire fund, it is deemed mutually respectful to both the giver and the receiver. This contributes toward the generation of respect wealth within the collective rise, which can strengthen the long-term sustainability of the Partafaire system itself.

The free healthcare within the 5th ranked rooms are not only funded by the higher ranked rooms, donations, and investments. The lowest ranked rooms are also funded by people who decide they do not want their Partafaire aid for whatever reason. In this case, that associated respect wealth is redistributed toward the rooms most in need of Partafaire aid

within the hospital. This system is designed to distribute resources toward those who need them most, while wealthier patients remain naturally disincentivized from entering lower ranked rooms because those rooms lack the luxuries they are accustomed to.

Insurance, Competition, and Mutual Respect

Yet, within Partaceyist hospitals, the extent of what luxuries cannot exist within lower ranked rooms should be decided independently by each Partaceyist nation. The ranked rooms all possess one thing in common: they provide the same universal standard of healthcare regardless of which ranked room a patient stays within. The ranked rooms only determine the luxuries and comforts a patient receives during their stay in the hospital. In some nations air conditioning may be considered a necessity, while in others it may be viewed more as a luxury. All nations require different healthcare systems, therefore Partafaire must remain flexible enough to change according to the will of every nation.

Also, for the higher ranked rooms, health insurance will still exist for those caught in the middle of the economic ladder. We still need private insurance because centralized healthcare aid is not flexible enough to address the diversity of physical conditions that patients have. Private insurance can adjust itself to the specific conditions of the patient, to maximize the mutual respect they receive from their stay at the Partaceyist hospital.

Therefore, patients whose Partafaire aid is lower due to their financial condition can still receive additional assistance through private healthcare insurance. Although, if someone is still unable to afford their healthcare even with their Partafaire aid and insurance, then patients can still generate mutual respect through respectfully engaging with their doctors and medical treatment, which can increase respect wealth for both the patient and healthcare institution. Insurance organizations and hospitals will comply with lowering costs because prices are not what they are after, they are after the sweet pay, embodied as mutual respect to others and their surroundings.

Therefore, the lower the price, and the more mutual respect generated, then the more profit will be generated for the patient, the hospital, and the insurance organization alike. Within Partafaire, local hospitals will oversee the management of their own Partafaire funds so that these funds can be used more effectively toward the maximization of mutual respect generation. This can make the entire Partafairist system more adaptable to local tragedies and local medical conditions, while also allowing hospitals to specialize in treatments needed most by their surrounding communities.

The Partafaire system is also influenced by a European healthcare system called the Bismarck system. According to the AHAAP, “The Bismarck model is a universal healthcare system where everyone is required to have health insurance by contributing to a government sickness fund, run by non-government insurers” (1). This model is reflected within Partafaire through hospitals managing their own Partafaire funds while

organizations and individuals can jointly donate toward insurance organizations or Partafaire funds to help finance the private healthcare insurance some people may still require.

The Bismark system has been developed within nations like Germany, France, Japan, Switzerland, and Belgium. Within the Partafairist healthcare system, insurance prioritizes mutual respect for the patient because it exists within a Partaceyist economy. Therefore, if a hospital genuinely cares for, supports, and fully treats a patient, then the hospital's prices will decrease while hospital workers increase in pay. The same principle applies to private healthcare insurance. Respectful private healthcare insurance that covers more will cost less for the patient, while insurance that covers less will become more expensive due to being more disrespectful toward those who depend upon private healthcare insurance to survive.

Therefore, hospitals that purposely pursue disrespectful and hateful policies to raise prices will be punished by the incentives of the emotional market itself. This punishment will be seen through competition, in which healthcare providers that better maximize patient well-being will possess cheaper insurance and cheaper bills overall. Hence, competition between many hospital organizations will pressure disrespectful hospitals to reconsider the act of disrespecting patients. This is done to keep mutual respect, competitiveness, adaptability, and mutual care at the core of the mission for all hospitals within the Partaceyist emotional market.

Chapter 6

Partaceyist Nationhood and Trade

Healthcare heals the nation, which is why the nation state of the Partacey flourishes in such epic beauty. The conception of a nation state within a Partacey can be best understood by playing a little game called Game Theory, developed by John von Neumann and Oskar Morgenstern. The competitive interpretation of Game Theory states that people are disincentivized to cooperate because actors do not know the preferences of the other people within an interaction. Therefore, when this distrust becomes structurally embedded into interactions, societies often develop centralized institutions to stabilize national cooperation.

Therefore, political theorists and economists influenced by Competitive Game Theory often argue that a centralized authority, like a state, is required to give people a common shared experience of living in a society. Hence, the idea is that a common shared experience of living in a state, combined with authority from a centralized government is required to limit the possibility of unknown preferences between actors within an interaction. This theory developed by John von Neumann and Oskar Morgenstern might

sound valid and true. Although, you are only thinking that it sounds true because this model fits very well within the societal model of Supply and Demand. Yet, Partaceyism is not Supply and Demand. Therefore, Competitive Game Theory has a different effect on society within a Partaceyist society than a society ruled by Supply and Demand. In essence, what I mean by this is that within Competitive Game Theory, collective action is disincentivized, since people's preferences are almost always misaligned when incentives promote such behavior.

Yet, under an emotional market, collective action becomes structurally incentivized because mutual respect is recorded and becomes economically meaningful through demonstrated action that you cannot undo. This is because when people interact with each other, the value of mutually respecting others is recorded in its raw form. This recording is done by an observer, AI, or those in the interaction using paper, videos, apps, etc. The fact of the opinion being selfish or not does not matter since their opinions are supposed to be their own. What binds society together against fraud and manipulation is their shared desire for mutuality, building transparency organically.

Therefore, fraudulent recordings become increasingly difficult to sustain without generating widespread mutual distrust. What strengthens society is society itself. In our current societies, society is bound together by authority, which is an external force that can be challenged by mutuality. Therefore, Partaceyism internally develops authority independently of anything else, through mutual engagement, while geographic nation

states externally impose authority onto society. I can show you how this works by demonstrating a theoretical scenario of two incentives clashing. Therefore:

Competitive Game Theory interaction before factoring in the emotional market:

Actor A Cooperates

→ B Cooperates: (3 , 3)

→ B Defects: (0 , 5)

Actor A Defects

→ B Cooperates: (5 , 0)

→ B Defects: (1 , 1)

In this case, the Nash Equilibrium stabilizes at mutual defection (1-1) because defection dominates under uncertainty. Therefore, even though mutual cooperation at (3-3) is collectively better than (1-1), the incentive structure pushes both actors toward selfishness. Hence, creating a society where people look after themselves first and others second.

Although, now let's factor in the emotional market in this game:

Competitive Game Theory after factoring in the emotional market:

Actor A Cooperates

→ B Cooperates: (6 , 6)

→ B Defects: (0 , 4)

Actor A Defects

→ B Cooperates: (4 , 0)

→ B Defects: (1 , 1)

What is being shown here is not a moral preference, but a formal change in the structure of rational decision-making. In the original Competitive Game Theory model, defection is dominant because it strictly protects individual payoff under uncertainty. Cooperation fails not because it is collectively worse, but because it is individually unsafe within the payoff structure.

However, once mutual respect becomes a recorded and economically meaningful component of interaction, the payoff structure itself is altered. Cooperation now produces an additional form of value that defection cannot replicate or access. This means that the

total return from cooperation is no longer equivalent to material payoff alone, but includes a systemic gain from mutual recognition.

Therefore, the condition that previously guaranteed defection as the rational strategy no longer holds. If cooperation consistently produces higher total value than unilateral defection, then defection loses its dominance as a best response.

This is the great proof: when the payoff structure rewards mutuality more than isolation, cooperation becomes the equilibrium outcome without requiring external enforcement. Therefore, if both actors cooperate, neither actor has an incentive to defect, since defecting would reduce their gain from 6 to 4.

Although, if one actor refuses to cooperate while the other attempts mutual cooperation, then the interaction does not create the additional respect wealth that emerges from mutuality. The selfish actor may still gain something material, such as wealth they did not expend, yet they lose access to the greater value generated through collective cooperation. Therefore, the emotional market weakens the profitability of selfishness while strengthening the profitability of cooperation.

This shift changes how cooperation is stabilized under an emotional market, because its baseline assumptions differ from those of Supply and Demand. Under Supply and Demand, centralized authority is required to force stability onto society because distrust

naturally develops from competitive incentives. Yet, under an emotional market, stability increasingly emerges internally from the interactions of people themselves, since cooperation becomes economically rational rather than economically risky.

Thus, when you add something non-material, like mutual respect, into interactions between people, and make it core to the ability of people to obtain a gain, the incentives of people begin to change. This is not indicative of a fundamental nature of humanity, rather it is indicative of humanity being influenceable by what they interact with.

In other words, human nature is simply humanity individualizing itself within its own material conditions. Therefore, when people begin interacting with mutual respect as part of obtaining a gain, their behavior changes alongside the conditions they exist within. Thus, selfishness and selflessness are not fixed states of humanity, but reflections of the systems people participate in.

Henceforth, humanity can become inclined to cooperate by interacting with mutual respect through a currency based on the value of mutual respect within society. A society incentivized toward cooperation will reduce distrust between communities, since cooperation becomes the most beneficial outcome for all participants within the interaction. The societal consequence of this transformation is profound, because the foundation of social order begins shifting away from externally imposed authority and toward internally generated mutuality. Therefore, the emotional market does not merely

change economic behavior, rather it changes the equilibrium through which society itself reproduces stability.

Peoplization and Sovereignty

As cooperation becomes structurally self-sustaining through mutual respect, the very foundation of sovereignty begins shifting away from geographic domination and toward social association between people. Over time, people would start to build lasting trust across generations by working together respectfully for mutual benefit, gradually shifting a nation's focus from geographic territory to its people. This has been seen with Micronational experiments such as the Space Kingdom of Asgardia. The existence of this micronation is supported by David Furnues (2018), who states that, "An interesting example of the formation of a micronation is the Space Kingdom of Asgardia, founded by the Russian aerospace engineer, Igor Ashurbeyli in 2016. The nation has about 200,000 citizens and rapidly growing" (20). The Space Kingdom of Asgardia is a modern-day example of a non-territorial claimed sovereignty. Yet, Peoplization within Partaceyism is bigger than small micronational experiments.

In practical terms, a Peoplized sovereignty would organize institutions cooperatively rather than territorially. For example, a Peoplized state cooperatively shares the services of the nation with other sovereignties, within the geographic space of the community. Different nations can share convict courts, political courts, hospitals, schools, and even

buildings to host councils of varying sovereignties.

To organize the freedom of expression of each sovereignty, each sovereignty that shares an administration, commercial, or residential building should have an organized time frame to perform its sovereignty within the given space. This can be maintained by giving people citizenship within the sovereignties they belong to, so that communities can understand the laws and customs each sovereign entity abides by through its people rather than through territory itself.

In this system of nationhood, people should have the freedom to easily transfer between citizenships within a given geographic area of sovereignties. This can facilitate easier communication between communities, which can prevent chaos from happening, via the interactions always favoring mutual respect, under the emotional market.

Each sovereignty will have its own police to uphold the laws agreed upon by its citizens. When it comes to resources from the geographic land itself, like natural resources, then the respective sovereignties that have citizens where the resources are at, are incentivized to cooperate the mining and trading of these natural resources.

Property Under Peoplization

However, such a transformation in sovereignty would inevitably require a transformation

in the meaning of property itself. Within an Peoplized nation state, property is owned by those that are directly and meaningfully affected by that property. There is no middle-men, to own is to have a property that affects at least 50% or more of your daily life. Who directly and meaningfully owns the natural resources? It is those that mine the resources, trade the resources, and have their local environment socially and physically directly affected by those resources. If conflict were to erupt over natural resources, then the land being fought over would lose value because conflict is not mutual. Without mutuality, the natural resources will become a negative force onto all affected by the natural resources being fought over. This incentivizes factions to want to maintain cooperation, in spite of disagreements, since to not cooperate, is to become broke with nothing to show for it.

In practice, land will be owned by a collective that has shares that make up the aggregate total value of the land, which is derived by the mutual respect that the directly affected people of the land give to the land. It is like how people use shares to own companies, just in the form of land itself. This system of property allows people to keep their personal items as their own items, since personal items only directly affect one individual. It also allows families to own their own homes, just collectively, through the mother and father, and those who are not dependents, by having ownership shares that make up the aggregate total value of the house.

Also, this form of property can have workers within a company own the organization that

they work within, via the employees and employers having equal shares in the ownership of the business. This collective form of property is not government property because the government is not directly affected by everything within society. This is why public property is ineffective at local scales, since people who have no direct association within the land are making the decisions of the land. Hence, creating inefficiencies in addressing public concerns.

This system can be further stabilized through political courts within the local area, which can pass specific localized international laws and property laws tailored to each property under a condition of multi-sovereignty. These legal processes exist so that sovereignties sharing land, infrastructure, or institutions can cooperate with each other transparently. Since cooperation within an emotional market is structurally profitable, these courts would primarily function to maintain mutual coordination towards the maximization of mutual respect rather than enforce domination.

This form of property can scale up as cooperation becomes systemic within the relations of the sovereignties. As the scale of Peoplization increases, nationhood becomes more like a sovereign social club rather than a sovereign landmark. Thus, essentials are guaranteed through incentivized cooperation, while one's life is experienced in its fullest freedom within their given sovereignty. Land becomes not privately owned or government owned. Property becomes owned by the community!

Localization and the Structure of the Partacey

In essence, under this framework of property, I envision a community of small, decentralized sovereignties, that are independent, yet they are independent within the rights of their people to be their own people, with their own laws, customs, and ideals. When it comes to land, these sovereignties cooperate with each other, sharing their understanding of each other while preserving their own cultural identity, while benefiting from international cooperation. This creates an international order of Partaceyist nations that is under a coalition of sovereignties that are directly affected by a given property, issue, or event, that governs the land. Yes, the Partaceyist nation directs its sovereignty within its citizens' citizenship of the nation that they belong to, not the land. In this new context, the land is effectively owned by international coalitions of Partaceyist nations.

The Partaceyist conception of property makes truly large-scale decisions within Partaceyist societies the responsibility of international coalitions within shared political courts, which is governed by mutual respect and mutual law of what the legal processes are for these international relations. Henceforth, it is better to think of a Partacey as a local community rather than a huge, centralized nation state. Minority rights are protected through giving them a right to be in any sovereign Peoplized nation that they choose, they can even create their own sovereignty, as long as they cooperate with the sovereignties on their land.

People might state that nations need to be big, so that they can accumulate enough wealth to fund public services. Yet, look at one of the smallest nations on Earth, Luxembourg. According to Danielle Bossaert (2019), “In Luxembourg’s manageably sized ministerial departments, which on average 60-90 people, policy-making is characterized by a flexible and pragmatic working style” (43). Therefore, small governments can have flexible public administrations by their hierarchical closeness to their subjects. Russia has a large government, which makes Russia full of competing interests across a massive hierarchy, which limits the manageability of Russia’s ministerial departments, which limits the effectiveness of Russia’s public administration to address its specific local problems. Thus, one can conclude from this that nations are not efficient because of their size, but they are efficient because of their transparency and the emotional market will make transparency profitable to state actors, unlocking the key to creating a large Peoplized nation state.

A Partaceyist nation is free from bureaucracy to go local! Yet, to go local, we must abandon the idea of the geographic nation. Why? It is because nations that establish themselves around private, public property, and geography create a source of power that the locals within the region cannot effectively challenge. This creates fear within the local population that feeds the development of a centralized state, centered on its own property and geography.

The geographic nation is aggressively against self-determination within its own

geographic constraints because the geographic nation requires the local population to not have control over their own property that directly affects them. This makes the geographic nation desire unity, under the acceptance of the powerlessness of the community. The government of geographic nations requires the communities to assimilate towards its authority, so that the properties of the geography around the communities can be controlled and utilized by the geographic state.

Therefore, if a Partacey can be Peoplized, then the Partaceyist nation cannot feel this tendency towards authority, since property ownership is everchanging through those directly affected by it, which in most cases does not require the input of the entire government. This limits the power of land holdings to the scope of the land, therefore power becomes concentrated on people rather than land, since the people's scope can be national, while the land's scope will always be local. Without centralized ownership over land itself, institutions lose the ability to dominate society through territorial dependency. This forces legitimacy to emerge from the continued cooperation of citizens rather than from coercive control over geography.

The Partaceyist Military

The Partacey does this by becoming its own citizens and localizing towards their own respective level of cooperation. This makes the loss of land to a Partacey not as important as the loss of its own citizens, since the loss of land can be regained from cooperation,

which everyone is incentivized to continue such cooperation. Yet, the loss of a citizen cannot be regained by cooperation. Therefore, Partaceyist nations are incentivized to protect their citizens from threats, such as geographic nations, because death cannot be solved by the cooperation of finite beings.

These nations could be a threat to the Partacey, henceforth the Partacey will need a military to defend itself. The Partaceyist military is a decentralized command, for each council region. Councils make their own independent decisions, under a united goal of defending the communities of their Partaceyist nation. This can make the Partaceyist military hard to take out, since no one person holds all the decision power within the military. These military commanders are only in office when active wars are affecting the citizens of the Partacey and these military commanders are elected by the councils that they vow to protect.

Military Defense Councils are separate entities from the civilian councils of the Partacey. They serve as the military organizations responsible for coordinating the defense militias of each council region during wartime. During peacetime, the Military Defense Councils keeps a skeleton crew for the defensive posture of the Partacey to deter aggressors, under the guidance of the head representative. The military representative cannot be an active position during peacetime because their responsibilities focus on protection, while the responsibilities of the head representative focus on the will of the people. The head representative is simply more aligned with the aggregate mutual respect of society to

guide the military in peacetimes than the military representative.

If war does come, the military commanders of the Partacey are forced to obey the wishes of the council members. If they fail to do that then they will be disrespectful to the people they represent, which is against what the Partacey is trying to protect. Therefore, military commanders are incentivized to obey the councils, since not obeying leads to the military commander losing out on a good contribution towards the collective rise, or removal from office entirely.

Also, the People's Union appoints, with a two-thirds majority of the citizens of the whole Partacey, a military representative that organizes unified strategic defense plans, including troop training, to be carried out by the council militias, unless 90% of the councils disagree with the strategic defense plan. Strategic defense plans require a higher threshold than other decisions to maintain order and stability during wartime. This order gives information consistency, which keeps the lines in position on a strategic level. Thus, the military representative can coordinate unified defense without permanently centralizing military power within the Partacey.

On the local level, tactical defense plans are assisted by the military representative, yet tactical operations themselves are drawn up by Military Defense Councils to align with and implement the strategic defense plan according to their own material conditions. However, if a two-thirds majority within a Military Defense Council disagrees with the

assistance of the military representative, then the Military Defense Council can independently draw up and execute its own tactical plan. This preserves tactical flexibility within a fast paced war, while still maintaining unified strategic coordination across the Partaceyist military.

The military representative can only coordinate unified defense plans, it is the duty of the Military Defense Councils to enact these plans. Yet, if mass concern above 90% is demonstrated against the strategic direction of the military representative, then the councils of the People's Union can quickly re-elect a new military representative with a two-thirds majority. Yet, if the military does not address the mass concern, then their contribution to the collective rise could decrease. Thus, hurting the pay of the entire military, and their unity with it. This prevents military authority from permanently consolidating itself, while still preserving wartime stability during moments of existential danger to the Partacey.

Within the Partaceyist military, soldiers are obedient to their Military Defense Councils because they must be to conduct their duties in the harshness of war. Soldiers obey their commanders during military operations, yet retain the democratic right to elect or remove those commanders through the structure of their given Military Defense Council.

Once considering the separation of powers in the Partaceyist military, one can conclude that the Partaceyist military hierarchy is as follows: **The People's Union → Military**

Representative → Military Defense Councils → Soldiers.

Also, due to the existential threat of war to the Partacey, military commanders can enact their own military decisions for their council militia. Yet, these decisions can only be enforced if a two-thirds majority approve of the military commander's decision, since the members of the council can also be within the militia too. Therefore, since the military commander needs the support of the councils to be legitimate, coups would be disincentivized since military commanders are only legally effective in cooperation with the People's Union. Also, if a group of councils agree with it, then their council militias can form coalitions, to temporarily centralize their operations, in an horizontal hierarchy of councils, and grow their troop numbers for defensive maneuvers that need it.

What about the organizations? The organizations, motivated by increasing mutual respect for the Partacey, via the protection of the citizens, will produce weapons, such as drones, ammo, equipment, and vehicles. These organizations then give all this military equipment to the militias of the councils. These militias are organized by voluntary recruits, since defending the Partacey is mutually respectful for them and for their communities. Hence, the only mutually respectful war is a defensive war.

This means that if a Partacey used these militias for offensive wars, then the mutual respect within the recruits will be far lower than a defensive war. Therefore, the Partaceyist military will suffer from mass desertion, which will make the Partaceyist

military lack the ability to effectively conduct an offensive operation. Thus, offensive warfare becomes structurally unprofitable within the emotional market itself.

Henceforth, the Partaceyist military is solely a defensive military. Thus, when the Partacey is secure and safe from the attacks of the geographic nation, then the Partaceyist military can declare victory, since there is no victory in an offensive war. Therefore, the Partaceyist nations are very unlikely to go to war with each other, since they all share this unprofitability of offensive warfare. Yet, some may say that a decentralized military cannot address the challenges of a more centralized state.

I believe that the militias of Makhnovshchina, (a group operating with southern Ukraine during the Russian Civil War), disprove the idea of decentralized militaries as ineffective. This is supported by Colin Darch (2020), who states that, “The makhnovtsy, with their guns tucked under their greatcoats, boarded an early morning train for the centre of Ekaterinoslav. The trick succeeded, and the insurgents quickly captured the railway station, while fierce fighting broke out in the city. The communists captured the bridge into Ekaterinoslav with the loss of only six men” (36). This style of warfare was what Nestor Makhno was known for, since he was a military trickster. There have even been stories of Nestor Makhno escaping battles by wearing wedding dresses, or hiding in coffins. The Partacey should utilize the decentralized nature of trickery against external aggressors because trickery is effective, no matter what rank you are or the size of your military force. A Partaceyist military that utilizes trickery is a military that can

decentralize itself in battle and minimize its own casualties in the same light as what was done in Makhnovshchina between 1917 to 1921.

Philosophically, the Partacey must always avoid centralized military structures because a centralized military is a weak link of the nation that can be easily controlled and turned into authoritarianism. This is what happened to Bolshevik Russia during the Russian Civil War, and I do not want it to happen to any Partacey within the world. So, a decentralized military is for the sake of the future of the Partacey, at the dismay of those who want to destroy the communities of the Partacey. Henceforth, the Partaceyist military can use collective property to promote mutual respect and constraint, to protect its decentralization in the face of war, for the sake of the dignity of the Partacey.

Locbalism and Global Trade

Partaceyism can prevent centralization in war through tying one's direct effect on the people around them to their paycheck. Thus, if a leader goes rogue and decides a profitable life is no life to live, his or her supporters will need to make the same decision to spread the centralization of power. The issue with this is that supporters of a leader tend to align more from the incentives of joining the leader than from ideology itself. Therefore, most would not forgo a life of mutual respect toward the institutions that make it possible, which greatly limits the influential power that a single individual has over society. This makes a Partacey inherently easier to decentralize, even under stress,

because everyone's lifeline rests on maintaining the directness of their mutual respect toward others.

Therefore, the Partaceyist nation is meant to be localized. Yet, does localization mean that large-scale organization becomes impossible? It might not, since according to Asuman Altay (2016), "Allocative inefficiency in bureaucracy arises because private sector decisions are all embracing. There exists a distribution of voter preferences for taxes and public sector outputs around the actual decision outcome" (47). Therefore, bureaucracies dominated by private interests can become inefficient because they fail to align with the actual needs of the public. The collective rise within the Partacey makes payment a public good, which detaches worker payment from private ownership. Thus, the Partacey can organize large-scale systems while still remaining mutually respectful, so long as power serves to increase the power of those around it through localization and mutual cooperation.

Yet, even if the nation is localized, that does not mean that it cannot contribute toward global trade. This is seen in the Partaceyist model of global trade called Locbalism. Locbalism is the compromise between local trade and global trade. If you combine the local with the global, you get Locbalism.

Within the idea of Locbalism, centralization is used only at the international level as a coordinating structure, because it is more effective for sovereign nations to voluntarily

participate in its benefits rather than have it imposed upon them. It remains centralized in structure, but not in enforcement, preserving the autonomy of each participating sovereignty.

Locbalism functions within a local framework that protects the economic sovereignty of Partaceyist nations through what is called the zero-dollar policy. This policy is enforced by a global centralized trading organization resembling the modern World Trade Organization. Its responsibility is to ensure that when products cross into an emotional currency zone, the respect wealth previously attached to those products is immediately transferred back to the collective rise of the exporting nation. These zones are geographically populated areas composed of various sovereignties, which measure value through a shared understanding of mutual respect.

If a product is transformed, such as raw iron becoming iron parts, then new opinions are generated around the transformed product while the previous respect wealth remains attached to the earlier stage of production. Therefore, value follows transformation rather than merely ownership. Locbalism applies this principle internationally by resetting the value of products when they cross into a different emotional currency zone.

This model prevents developed nations from economically dominating underdeveloped nations because products entering another emotional currency zone begin as a blank slate. The importing population determines the value of those products according to its own

conditions, customs, and needs. Thus, local populations retain sovereignty over valuation instead of surrendering it to international capital.

A global trading organization enforces the zero-dollar policy by monitoring international trade routes, shipping systems, and economic zone border crossings through satellite data and logistics reporting systems. Shipping organizations are incentivized to obey these regulations because violating them would reduce their contribution toward the collective rise. Therefore, cooperation within international trade becomes more profitable than manipulation.

Products traded internationally could carry QR systems or similar tracking technologies that verify when products cross emotional currency zones. Shipping organizations would then report the respect wealth attached to their goods so that the proper transfer of value can occur between these economic zones.

If foreign products reset to zero upon entering another emotional currency zone, then what incentivizes trade between Partaceyist nations? The incentive comes from generating mutual respect through trade itself. Products that obey the zero-dollar policy, remain environmentally sustainable, and benefit the importing society generate increased respect wealth for the exporting nation. Thus, all sides benefit from mutually respectful trade.

Locbalist trade also eliminates large-scale international debt between Partaceyist nations because the respect wealth generated from exports is transferred directly into the collective rise of the exporting society. The importing society receives the products themselves and determines their value independently within its own emotional market. Therefore, each emotional currency system maintains sovereignty over valuation without creating international debt dependency.

Henceforth, to see how Locbalism plays out practically, imagine that raw iron is mined within a Partaceyist Democratic Republic of Congo. The iron receives opinions of 6/10, 7/10, 5/10, and 2/10. This iron is then transformed into iron parts, generating new opinions of 7/10, 8/10, 7/10, and 4/10. A decision is then made to export these iron parts to a Partaceyist Brazil, where their value resets to zero upon crossing into Brazil's emotional currency zone.

The PDRC calculates the price of the iron parts as 9.10 respect wealth.

26/40 = 0.65.

1 - 0.65 = 0.35.

26 * 0.35 = 9.10 respect wealth price.

Assuming four people exist within this simplified society, the pay generated from the trade equals 6.5 respect wealth per person.

26/4 = 6.50 respect wealth pay from iron parts evaluation.

The cost burden of the iron parts is therefore 2.30 respect wealth per person.

9.10/4 = 2.30 cost burden per person.

This shows us that price never goes over the capabilities of the individual within a Partacey.

Once iron parts leave the jurisdiction of the PDRC, the value of such is retained within the PDRC and sent to its collective rise before export. When the PDRC trades with Partaceyist Brazil, they convert these iron parts into a car. The car then receives new opinions of 6/10, 9/10, 6/10, and 3/10. Therefore, Brazil generates 6 respect wealth per person.

24/4 = 6.

The total price of the car becomes 9.60 respect wealth. Dividing by four gives us a cost burden of 2.40 respect wealth per person for the evaluation of the car.

24/40 = 0.6.

1 - 0.6 = 0.4.

24 * 0.4 = 9.60.

In essence, price is recalculated per locality within Locbalist trade. Therefore, profitability within international Locbalist trade emerges when localized mutual respect generation exceeds the localized cost burden imposed upon the population. In this case, both parties profit from trading with each other.

This simplified example demonstrates how Locbalism shifts competitiveness away from exploitative labor and toward the ability of societies to generate mutual respect through production itself. The PDRC became more competitive by increasing the mutual respectability of its production process. Meanwhile, Brazil valued the finished car less positively, which reduced the profitability of the product within Brazil's emotional market. Thus, this makes international competitiveness dependent on cooperation with local populations rather than on the ability of foreign capital to overwhelm them.

In the modern global economy, trade is often structured around scarcity and international capital rather than the needs of people themselves. Yet, according to Lyla Mehta (2010), "Scarcity rarely takes place due to the natural order of things. Instead, it is usually the result of exclusion and unequal gender, social and power relations that legitimize skewed access to and control over finite and limited resources" (3). Therefore, scarcity is often socially reinforced through unequal power relations rather than purely natural limitation.

Under Locbalism, local populations regain authority over valuation. Scarcity still exists materially, yet it becomes a condition to cooperatively manage rather than a force organizing all of society. Thus, trade based on mutual respect becomes more sustainable for the long-term development of humanity than trade organized primarily around capital accumulation.

Locbalism also functions alongside Peoplization. When a foreign product is jointly owned by citizens belonging to different Peoplized sovereignties, the opinions generated around that product contribute toward the respective collective rises of those citizens. Therefore, products distributed across shared geographic zones contribute value across overlapping sovereignties rather than exclusively toward territorial governments.

International projects between Partaceyist nations and Supply and Demand dominated nations can also exist through donation systems. Since donations are gifts, the respect wealth generated through those donations flows into the collective rise of the exporting Partaceyist nation, while the donated material value supports the foreign project itself. This allows infrastructure projects between similar and different economic systems to remain possible.

Partaceyist nations should trade with Supply and Demand dominated nations because trade increases national development and quality of life. According to Michael R. Mullen

et al. (2009), “Results suggest that international trade is associated with economic growth that enhances the well-being of people and their ‘visible’ natural environment but with a deleterious impact on global warming through increased CO2 emissions” (255). Under Partaceyism, environmental protection becomes profitable within trade itself because environmental harm lowers mutual respect generation.

Partaceyist nations can trade with Supply and Demand dominated economies by resetting the value of imported goods upon entering the emotional currency zone of the Partaceyist nation. This preserves the autonomy of the emotional market while still allowing international exchange. Therefore, Locbalism allows local economies to shape global trade because the people directly affected by goods and services determine their value instead of international capital. This creates a stable and culturally diverse trading system organized around mutual respect between all affected populations.

The global organization governing Locbalism would consist of head representatives from Partaceyist nations alongside representatives from Supply and Demand dominated nations. These nations should participate because Partaceyist societies should remain open to trade with all peoples. The head representatives vote according to the authority delegated to them by their respective People’s Unions. Each sovereignty within the Locbalist network receives an equal vote. Workers within the global organization would also remain connected to the collective rises of their respective Partaceyist nations. Within the centralized organization, trade regulations are determined through a two-thirds

majority across the organization. This limits the emergence of Partaceyist superpowers while preserving fairness between sovereignties.

This central organization would also mediate resource coordination between economies. For example, one Partaceyist nation may desire coffee while lacking the environmental conditions to produce it. Another nation capable of growing coffee may recognize the mutual benefit of exporting coffee through Locbalist trade. Trade agreements would then be reviewed collectively by the affected sovereignties, through activism and cooperation. If two-thirds agree that the arrangement is mutually beneficial, the agreement could continue until material or social conditions fundamentally change.

If a fully global organization cannot initially be achieved, regional trading organizations between Partaceyist nations could still facilitate Locbalist trade. Yet, a global organization would ultimately be more efficient at coordinating mutual trade across humanity. I understand that it can be difficult for every nation on Earth to agree on something, and I want to mutually respect the opinion of every sovereign nation across the globe. For what could be more respectful to our history as a species than being together in our diversity through mutual collaboration?

Chapter 7

The Partaceyist View of History Part 1

In alignment with respecting other nations, I want to mutually respect the one that attempts to read this work of mine. Therefore, you should understand why we need Partaceyism in our currently failing world. Yet, we can only understand this failure by examining its drivers, the greatest of which is history. History, from a Partaceyist perspective, is not a sequence of isolated events, but an interconnected strife between causal, physical, and mental constraints throughout time. We must understand how we got here, so we can understand what we are missing by not establishing a Partacey in our modern-day world.

We can start in the Beginning, on day one of the Earth and light, or the first vast time period. Yes, the first vast time period, which is supported by 2nd Peter 3:8-9, “But you must not forget this one thing, dear friends: A day is like a thousand years to the Lord, and a thousand years is like a day. The Lord isn’t really being slow about his promise, as some people think. No, He is being patient for your sake” (2nd Peter 3:8-9, NLT). This verse shows us that the days in the creation story are much longer than one day. These

vast periods resemble thousands of years rather than a single day. This aligns with an account in which God patiently formulated creation with causality and relationship, for our own good, that we see evidence of every single day.

This makes sense because a careful and loving God will create something with patience to reflect himself. Such a God would not rush creation, because He is in control of all things. Therefore, before day one, there was God, and he existed before creation. That is until he decided to respect the idea of creation in a non-selfish and non-selfless way that can only express its fullness in an infinitely interpreted way.

Primordial Respect and Creation

In the same way, materials can only be fully expressed through Respect, since God is above Respect, which is above materials. This is supported by Philippians 2, “That at the name of Jesus every knee should bow, in heaven and on earth and under the earth” (Philippians. 2:10, NLT). This quote from the Bible states that all knees or all of creation bow before the authority of God, even the timeless yet finite structure of Respect. Because Respect is structured and intelligible, it is not infinite, and therefore belongs to creation rather than God. Therefore, God used Respect as a finite expression of his relational nature, instead of a property external to him, which formed the structure through which we can understand the idea of respecting creation. God is connected to our universe, but separated from it, like how people are connected to wildlife, but are

separated from the everyday struggles of the wildlife.

So, what is non-selfish and non-selfless Respect that God commands? It is the intelligibility of the timely and the timeless that distinguishes what can be of benefit and disbenefit, independent of material biases or influences. A literal example of this causal metaphysical constraint, that is primordial Respect is from H. Bennett (1946-1947), who states that, “A pet monkey bit the hand of a Balkan king, and "of that monkey's bite a quarter of a million persons died”” (12). This example shows that good and bad are shaped by causality, since the effect of the monkey bite causes a quarter million people to die, yet it was not from the next step after the monkey bite, but the descending causes to the mass death that created the bad. Indirection leads people to individualize their interpretation of their relation within the structure of Respect.

Entropy is therefore good because without entropy there is no possibility for direct coherence, which forms relational love. A universe without relational love is a universe that has no possibility for causality, since love can only be done through causality. To say that love can exist independent of causality, is to imagine that love that goes nowhere. A love that goes nowhere is not love, but a breakup, therefore entropy must be good, for love to be good.

The structure of Respect gives us the ability to know anything, through the ideas we understand being stabilized into the finite timeless realm, from our actions in the timely

realm. If we develop the idea that there is a causal relationship between the monkey and the mass death, then it stays within reality as a real concept. Whether it is good to us or not does not matter on its own, since Respect guides both mutual respect and individualized respect. Yet, for this idea to be able to affect humanity for the good or for the bad, it must be caused and affect other things through its effect. Left on its own, the universe tends toward ordered mutual interaction (what I call mutual respect), since causes are always directly related to their effects.

What is respectful must be what is direct, and nothing is more direct than entropy. Entropy is what ties relations together, since it is the most fundamental finite direction. If the world blew up, one may say that's bad, but the universe, through its own enactment says otherwise within the witness. Entropy has no opinions or hesitation, it just is, and because of what entropy is, it emanates a sense of respectfulness within the witnesses of it. Our agency is what can produce individualized respect, which can introduce effects from a cause that are not directly related to its originating cause.

The Formation of the Universe

Therefore, when God commanded the creation of materials, he used a non-selfish and non-selfless Respect to create the conditions for these timely materials to align with the ultimate path of cause and effect in the long-term. Hence, back when Respect first interacted with materials, Respect split into two lower forms of existence, mutual respect

and individualized respect. Over time, God created our galaxy, from the use of primordial Respect, ultimately leading to our solar system. Throughout all of this happening, the planets mutually respected each other over time, via their gravitational interactions mutually stabilizing the solar system. The old age of matter and energy and its alignment to mutual respect proves that in due time everything that is indirect comes back to its direct origins.

Meanwhile, asteroids struck other planets in ways that can be understood as mutual interaction (what I call mutual respect) because the relationship between the planets and the asteroids were affecting both objects. Over time, Earth formed and these asteroids brought in water to cover the Earth, beginning day two within the creation story, by the mutual respect of the asteroids towards the Earth. This is supported by a study from NASA, from Elizabeth Howell (2018), which stated that, “A new study of a rare basaltic meteorites called angrites suggests that volatiles, which are compounds with relatively low boiling points such as water, could have been brought to our planet by meteorites during the first two million years of the Solar System” (1).

This suggests that God formed the universe through relational processes that I describe as mutual respect. Yet, to Him it felt like a day to create the conditions for life to form on Earth, by the will of God’s own authority and causal way. Individualized respect existed as a possibility, but individualized respect did not play a part in the formation of Earth, since Earth was formed as a mutual project between materials, under the authority of

God.

Scientists would agree to the Earth's formation being a mutual project, since they would say that Earth formed by matter combining together for millions of years, about 4.6 billion years ago. This is supported by Robert M. Hazen (2012), who states that, "Almost 4.6 billion years ago, such a trigger initiated our Solar System. Ever so slowly, over the course of a million years, the swirling mass of presolar gas and dust was drawn inward" (13). This means that matter needed to mutually affect each other to form Earth and then life came from asteroids that carry the materials necessary for life.

Although, these materials needed to be affected mutually by other materials within the newly formed watery Earth to create the amino acids necessary for life. This statement is supported by neurophysiologist Kreˇsimir Krnjevic (2010), who states that, "First and foremost, chains of amino acids make up the proteins from which tissues are constructed and enzymes developed to operate the intricate biochemical pathways that acquire and dispense energy, the essential characteristic of living organisms" (33-34). Therefore, the ingredients for life were formed by the direct causal forces of matter into amino acids, which formed proteins that eventually formed DNA and then life as we know it.

These amino acids were developed from chemical interactions from volcanic activity on planet Earth. This is supported by Martin J. Kranendonk et al., they state that, "After we realized that the Dresser had been filled with surface hot springs in a geothermal system,

it became clear that it also had contained many of the key ingredients and organizational structures required for the origin of life" (4). This quote shows us that life likely began on Earth from the aquatic dirt next to volcanoes, which developed amino acids and rose the land out from the water, creating dry land on Earth, reflecting day three within the creation story within the Bible.

The Birth of Life and Individualized Respect

Within the creation story, day four was the age of LUCA (Last Universal Common Ancestor) and prokaryote bacteria, in which life began, developed by the causal and patient grace of God. Therefore, when the first life was born on the fourth day in the creation story, they moved by a new form of existence, instinct, which necessitated the need for their continued state of being, against the causality of the matter around the first microorganism. This meant that life accessed a type of lower Respect that led to the development of agency, or the ability of an entity to direct its own path in its own existence.

Yet, this lower type of Respect was selfish and only meant for LUCA and its descendants, it was individualized respect. Therefore, the possibility for agency came first, then the lifeform with agency had a choice to decide to be sourced in mutual respect, like a rock, or decide to be sourced in individualized respect, to become life. LUCA can be understood as the first instance of life acting in an individualized way, consuming

materials to sustain itself instead of being a part of a greater mutual whole.

LUCA ate the first bite for its own interpretation of Respect. This interpretation of Respect was its own intelligibility to be what it desired to be, against all of existence. LUCA chose its own continuation of its state of being, at the expense of the natural state of the entropy of the universe. This was unprecedented! The first microorganism was the first material to interact with the universe by using individualized respect, instead of mutual respect. Yet, something strange happened to the microorganism. The microorganism desired the supply of materials, and the microorganism demanded to consume more of those materials.

Hence, the first proto-metaphysical seeds of the philosophy of Supply and Demand were born here, forged from individualized respect, which challenges the notion that Supply and Demand is a fundamental aspect of the universe. This is because Supply and Demand requires individualized respect to exist. Before this moment, Supply and Demand, as a unified force that tries to sustain itself, did not exist. Instead, materials were following the order of the entropy of mutual respect. This took the form of materials crashing into each other, causing a cause-and-effect relationship that was mutual throughout the universe. Hence, Supply and Demand is against entropy and the nature of the universe, in its truest form. Also, this means that the fear of death, or the fear of an end, is innately unnatural to the universe, since the materials never feared their own ends, but LUCA did.

Adam and Eve as a Metaphysical Parallel

Taking a step back from the passage of history, we can see that within the story of the creation, this same impactful moment in history of the birth of life is metaphysically called back with Adam and Eve when they ate the apple from the tree of knowledge and accessed individualized respect within their surroundings. This is supported by Genesis 3:6, which states, “The woman was convinced. She saw that the tree was beautiful and its fruit was delicious, and she wanted the wisdom it would give her” (Genesis 3:6, NLT). Eve accessed the individualized respect in her surroundings, to see the tree as beautiful. Hence, the possibility of sin must have existed before the Fall, although sin itself had not yet been actualized, in order for Eve to individualize her respect towards the tree of life and to start the Fall.

Therefore, the capacity for individualized Respect made sin possible, but it only became sin when enacted through disobedience. At the biological level, this can be metaphysically paralleled with a bacterium being drawn toward an amino acid; at the human level, this is represented by Eve being tempted by Satan. In both cases, what was previously only possible became actualized through a relation within the material world. What differs is that the bacterium represents an unreflective deviation from mutual respect, the metaphysical structure underlying sin, while Eve represents the beginning of reflective sin through a conscious deviation from mutual respect.

Day four was also the day when evolution began. Evolution does not disprove God, but proves the intentional design of God. This is because God is patient and wise. Therefore, would an all powerful being that enjoys creating want to make the universe in one week? That sounds rushed, like He was not enjoying the process. I believe that God enjoys creating, and one who enjoys it does not stop, but gets themselves stuck into it, like how I get stuck into a book that I read. Thus, the extreme length of evolution shows me that intentional design is more likely than random chance, since random chances happen quickly without care, yet looking at evolution, all I see is careful planning that marches its way towards us.

Also, on day four in the creation story of the universe, the sun, moon, and stars became visible, due to the birth of the first microorganisms on Earth, clearing the sky of volcanic gases, so that the stars may be seen on Earth. Some may say that God stating that death is bad is against the nature of the universe within this context, referring to 1st Corinthians 15:26, which states, “And the last enemy to be destroyed is death” (1st Corinthians 15:26, NLT). Yet, if God wants to destroy death, an ending of causal existence, then death is not fundamental to God’s creation, but merely a means towards the great end of heaven above. Therefore, God wants us to live with him, to be like his creation before the fall. This can be done by eliminating the enemy of the fear of death, by living forever, like the materials, with the creator of all.

Although, an additional note is that God allowed the ability for Adam and Eve to even

disobey him, by commanding Respect to coexist with materials, so God knew this could happen to Adam and Eve. Although God is not disrespectful to Adam and Eve by doing this because God made agency for our own mutual benefit towards him. This is supported by Deuteronomy 30:19, which states, “Today I have given you the choice between life and death, between blessings and curses” (Deuteronomy 30:19, NLT). This verse shows us that God gives us the choice, to mutually respect others, or to individualize our respect towards others, since to be mutual is to recognize that we are not alone.

Science, Religion, and Shared Truth

Henceforth, since our agency can be influenced by both individualized respect and mutual respect, it is less fundamental than the two, placing agency into the material realm of existence. When one considers that agency is within the material realm, it becomes evident that agency adds towards moral responsibility, as purely a force of direct action. This means that an indirect application of agency is one being incompetent to achieve what is mutually respectful to all. What all of this means is that both ideas of the Beginning share the same impactful moment when materials learned the ability to access individualized respect.

Therefore, the scientific view of the Beginning and the creationist view of the Beginning are derived from the same philosophical understanding of how Respect impacted materials. So, science and religion can coexist together, since they both share the truth.

Both of them are ideas of the Beginning that see it differently in aesthetics and in the organization of their vision of the Beginning but they fundamentally share that same truth within.

The Bible is made up of multiple books that interpret history differently. The Book of John tells history in a linear historical fashion, since John was an historian, so the message and events are literally truth. While the Book of Genesis tells history like a story, where specific dates are not necessary because the message is what is truth. They are all the truth, just told in different ways than our modern way of telling the truth.

I wanted to show you the truth of Genesis by structuring the Beginning within a Partaceyist context, based on its truth structure. Hence, this is why I did not give the exact dates up to this point. The creation of the universe could have taken a few days, a few thousand years, or billions of years. What matters is that the message holding it all together is true.

Therefore, science and religion can coexist together, and this can work by using the truth structure of Genesis. This truth structure of Genesis focuses on the message overall, rather than the small details of the story that we can never truly see for ourselves, since there is little evidence left from these ancient times. Although nowadays we have more capability to see this time period, yet at the time the Book of Genesis was written, the story is what truly mattered.

Why did the story matter? It was because the people back then could not understand the formulation of the universe and that would lead the followers into the weeds, when the truth lies within the meadows of the message. Hence, the story was prioritized over the linear makeup of events. Although now I will turn this view of history into the truth structure of the Book of John, since it is the view of modern historical analysis and the truth that we all understand the best. Although, keep in mind that the Bible and science share the message of truth in common.

The Not So Humble Squirrel

Now, I must address something. While developing this philosophy, I developed a great confusion at how this philosophical take looked onto the clearly violent nature of life. How can mutual respect be found in such violence throughout life within the Archean Eon of 3.8 billion years ago to the modern day of the Phanerozoic Eon? At first, I thought that life was against the nature of the universe, by just its very destructive individualized agency within nature. Yet, on a mediocre and gloomy day, not so far from the time that I am writing this sentence, I saw a squirrel eating a nut. What on Earth does a squirrel eating a nut living on March 5th, 2025, in the Midwest, have to do with the history of life itself? Well, to put it simply, this squirrel is everything and all of humanity owes a great debt to this not so humble squirrel.

This squirrel was eating a nut, so this squirrel was changing the nut, which is a cause-and-effect relationship that benefits the squirrel and the nut, in effect this was mutual respect influencing the material realm. The nut being eaten is not in of itself bad because the nut is benefiting the squirrel and the nut did not cease to exist, but changed its state.

Yet, the squirrel I saw then saw another squirrel and chased after that squirrel in an aggressive manner. To the untrained eye, this looks like the squirrel is competing with the other squirrel over this nut, and you will be right. Yet, why are the squirrels competing for the nut, if the squirrel were accessing mutual respect between the squirrel and the nut before this interaction. I observed these squirrels in aggressive detail, but with special interest with the squirrel with the nut. My observations revealed that this squirrel was doing something that the entire animal kingdom has been doing for billions of years, which has forged our current path of history today.

This squirrel viewed the nut as its own, which developed an extremely basic form of thinking about the supply of the nut and ‘who would want this nut that I have’. The squirrel was looking at the scarcity around it and concluding that it was important because ‘I need it to live on’. This is individualized respect! In its most basic form, even this squirrel reflects the structure of what we later call sin, through emphasizing itself over its own surroundings. This was different from the relationship of Supply and Demand with microorganisms, since the microorganisms just used Supply and Demand

for its eating of that food.

The microorganism had no ideology, no aggressive bias, it was just mindlessly following the influence of individualized respect, almost material, but just barely life. The squirrel was not mindlessly being affected by its own individualized respect, the squirrel claimed the nut, using the supply of the nut and the demand for the nut as a justification to need this nut. What became biological became ideological. Henceforth, the squirrel had a more developed relationship with its philosophy of Supply and Demand than the microorganism because the squirrel had the agency of wanting the limited supply of the nut. In effect, how creatures interact with the changing systems of relational coherence affects their sense of self within the universe.

So, it is not just Supply and Demand that is affecting the squirrel, instead it is this greater framework that is affecting the squirrel, even if it knows it reflectively or not. In other words, the squirrel was an Economic Materialist, since Economic Materialism is the philosophical framework of Supply and Demand onto the living agents of the universe. Economic Materialism is a self-reinforcing ideological feedback loop grounded in individualized respect, which enforces a mental focus on engaging within the universe based on the amount of supplies and levels of demand around the living agent.

Economic Materialism is a quasi-agent, like evolution or markets, its foundation is the selfishness of a living being that grows through selfish relation. It emerges from both

individual and collective behaviors of selfishness in a way that adapts, persists, and reorganizes systems to sustain its own logic. It behaves like an agent without being one itself. Hence, this extremely basic ideological framework gave the squirrel justification to be aggressive and to be competitive against other squirrels, for the squirrel's own nut. Therefore, competition is a byproduct of the philosophy of Supply and Demand within the animals of the animal kingdom. This framework is not just an idea, but a real disease within life itself.

Scarcity, Entropy, and the Failure of Competition

All of the eons of life had this philosophy of Supply and Demand take control over them, which develops aggressive behaviors that then leads to the violence that we see within nature, like the violence I saw between the two squirrels over that nut. This sounds bleak, yet this observation showed me that scarcity doesn't obey Supply and Demand. Scarcity is more fundamental than Supply and Demand, since it forms its framework. Therefore, in principle, an economic system can remove Supply and Demand without removing scarcity itself. Scarcity explains the physical processes, but the philosophy of Supply and Demand explains how those processes develop into chains that we both must and can break.

Henceforth, where is scarcity sourced from? Scarcity is sourced from the material realm, where there is a finite number of things. This finite existence is innately an inefficient

realm to exist within because scarcity is sourced within the lowest fundamentality of the universe, finitude. Therefore, scarcity has less influence the higher you move in the structure of the universe. This means that scarcity influences mutual and individualized respect less than the materials of the material realm.

Therefore, since scarcity is not fundamental to the overall big picture, then what can explain why the squirrels are competing over a nut? This interaction within nature exists because it comes from the squirrel's own individualized respect of the nut, the squirrel views reality, not holistically, but individually. Think about the interaction closely. Since, the squirrel saw the nut with individualized respect, the squirrel, without realizing it, wanted to be intelligible, in the form of being respected, by having that nut benefit its own life. Yet, the nut has no agency, nor access to individualized respect, therefore the nut is not an agent in this interaction.

Henceforth, the nut simply tends to be mutually changed or tends towards mutual entropy within the interaction. This is supported by Daniel J. Reurink (2025), who states that, "This concept extends beyond classical thermodynamics to encompass quantum and cosmic scales, where entropy governs the multiplicity of possible configurations of particles and energy states" (2). This quote supports that the universe is most efficient when there is the most amount of entropy because that is when the possible configurations of particles and energy states are maximized to develop the most amount of mutual causality within the system.

From a physical perspective, the likely outcome is digestion, increasing entropy, so that the nut can become a more efficient physical state by becoming more disordered. The nut is in a process that does not let it die, but allows it to become a different causal form of itself. Within the same moment, the squirrel wants to eat the nut, so that the squirrel can obtain this energy from the entropy of the nut. The squirrel has a selfish motivation to want the entropy, but the nut has a selfless motivation to want the entropy. Yet, in the end this relationship would tend towards mutual benefit, since the process of the squirrel wanting to eat the nut follows the logic of a cause leading to an effect. In essence, throughout all of the history of life, lifeforms have been fighting causality, but failing at every turn.

From microorganisms, to the ancient fish, to the ancient insects, to the mammal-like reptiles, to the dinosaurs, and to the mammals. All of life throughout the fifth day of creation, from the Archean Eon to the Miocene Epoch, has this relationship between entropy and life, in which life never escaped entropy, and entropy always prevailed. In essence, the animal kingdom has a path to access mutual respect and to live within it. Yet, the first microorganism ate the forbidden material, the forbidden supply, that caused the demand for the material, which was first derived from the individualized respect around the microorganism rather than from the mutual respect around the microorganism. Supply and Demand became the barrier for life to be in harmony with the materials.

Supply and Demand, once born, did not remain confined to microorganisms. It scaled with life itself, embedding into every layer of biological existence. Hence, the violence of nature, the supposedly state of nature that is brutish and short, as Thomas Hobbes so eloquently put it, is chronically inefficient. Competition by its very nature is inefficient because competition attempts to impose order on a universe that is already ordered. There is no greater inefficiency than this! No wonder the species of the squirrel had remained so basic and underdeveloped within their sense of self for millions of years! No wonder most of life has been so basic for so long, for billions of years! Life got itself into a trap, the trap of Supply and Demand, and life had no idea about its own chronic failure from the start.

Humanity and the Homo Genus

Although nature is nuanced, since joy and happiness are directly linked to life, you cannot have joy without life. Yet, to have life, is to inherit this accessibility to individualized respect from the descendants of LUCA. So, how do we deal with the inefficiency of nature and its link towards what makes us human? We must escape our dependence on nature, by heading towards God, who protects the mutual respect that He used to create nature, including the animals, plants, and the environment. In essence, protecting nature protects the agency of life, to make another choice, to be sourced in mutual respect. This opportunity comes from God, so we should not rely on our own individualized perspective to protect nature, but follow God's causal will, allowing nature

to heal from our selfishness.

After billions of years of joyful patience within God, in spite of the horrors of life, comes day six. We see that by the end of day six, God looked at the enslaved animals throughout the billions of years and saw both the good in the agency of life for mutual love and the bad within the agency of life to preserve itself. Henceforth, God saw a missing piece within the universe, which was the lack of philosophizing beings made in the Image of God, to use this agency to worship Him, for their sake, instead of merely surviving in His creation. Therefore, as the Cenozoic Era came towards its end, a genus of creatures, forged from God's intentional use of mutual causality for billions of years, patiently saw the efficiency of cooperation, of mutual respect, through God and through the materials around them! A genus of creatures saw that if they used materials and changed them into tools, they then could use these tools to kill animals, transforming them from threat to food through mutual physical processes.

These creatures were not done yet, they started fire from the tapping of rocks, using the entropy, the efficiency of the universe, to change their kill into something that would give the relationship between the carcass and the species more mutual benefit. Hence, aiding in their advancement across the globe via these technological advancements, which initially challenged the dominance of the philosophy of Supply and Demand. These creatures are the Homo genus.

According to A'ndrea Elyse Messer (2015), “The earliest known record of the genus Homo -- the human genus -- represented by a lower jaw with teeth, recently found in the Afar region of Ethiopia, dates to between 2.8 and 2.75 million years ago” (1). The location is supported by the Bible, which states, “Then the LORD God planted a garden in Eden in the east, and there he placed the man he had made” (Genesis 2:8, NLT). Guess what was east of Israel, the audience of the Bible. The Afar region of Ethiopia, at least when you see the whole planet as holistically east and west, like how a creator of a planet would see it, since north and south means nothing in the vastness of space, where God created Earth. In essence, the patient causal will of God forged the path to the development of man, by slowly making man from the dirt through evolution. Yet, when looking at the history of life, the development of the Homo genus was not a long time ago, so why the Homo genus? Why did God give the Homo genus the ability to access more mutual respect than any other animal in the animal kingdom?

It is because God gifted the Homo genus a common trend, the need to cooperate to survive, within the capacity for the species of the Homo genus to choose to reflect the Image of God or not. This necessitated mutual respect within communities, to maintain the fragility of God’s perfectness being imperfectly represented within the Homo genus. The forming of the mutually supportive community gave rise to the increased accessibility of the influences of mutual respect, which in effect, metaphysically reflected the holy trinity of God. God reflected causality, Jesus represented man, and the Holy Spirit reflected the mutually supportive community. These communities developed

further into the accessing of mutual respect within the surroundings of the Homo genus, which slowly facilitated the development of technological stone tools and fire.

Henceforth, the Homo genus challenged the philosophy of Supply and Demand, which was dominant within the animal kingdom, by developing communities with mutual respect to each member of their tribe. The Homo genus developed a path different from the animals, to be less dependent on individualized respect. Although, all lifeforms accessed both mutual and individualized respect, and the Homo genus were the lifeforms that accessed mutual respect the most, which gave life on Earth enough hope to live how God intended. God then rested on day seven.

The Development of Morality and its Relation to Mutual Respect

The Homo genus, influenced by the continual access to the mutual respect around them, developed a sense of self slightly more orientated towards mutual respect than individualized respect compared to the rest of the animal kingdom. Over time, this development of the sense of self, or how they interacted with change, developed into a familiar human-centered social environment, in which a sense of what is good formed within the Homo genus. This social environment, dictated by the primordial Respect around them, was interpreted into an imperfect innovation of the material and the relational, called morality. This embracing of morality separated the Homo genus from God, since morality was not purely mutually causal, but influenced by individualized

interpretations of Respect, such as preservation of knowledge and material livelihood for the sake of the Homo genus.

Therefore, morality is a stage of the development of the sense of self, in which attentive awareness is developed for the condition of the self and the community. For the Homo genus, morality was developed to protect their communities from external threats like predators and internal threats like the disunity of the community. This is supported by Michael Tomasello (2018), who states that, “The key insight is a recognition that individuals who live in a social group in which everyone depends on everyone else for their survival and well-being operate with a specific kind of logic. In this logic of interdependence, as we may call it, if I depend on you, then it is in my interest to help ensure your well-being” (1). This interdependence logic is what makes the Homo genus different from animals’ attentiveness towards themselves and others, which is shared by all prey within the animal kingdom.

Yet the Homo genus had community, which formulated organization and unity, from their own attentiveness to both their external and internal survival. This developed into a morality for humanity that is less fundamental than the mutual respect around the universe. This is because morality is forged in the material conditions of the Homo genus while mutual respect is forged from the conditions of the universe. An example of the metaphysical divergence of morality and mutual respect is that people see killing one person to save four as moral and killing four to save one as immoral. Meanwhile, mutual

respect would see that the choices are personalized, and therefore not mutually respectful.

Morality is not non-selfish or non-selfless because many people will still save one person, if the four people were instead crickets. In this case, most train conductors do not even think about all the crickets that get run over by their own trains. Therefore, we would quite willingly sacrifice a few crickets to save a fellow person. Yet, this is selfish, since we are valuing the life of a specific entity, based on our shared material identity rather than the universal presence of the material entity itself.

Henceforth, if a train is headed toward either four crickets or one person, and the conductor's action is indirect to either outcome, then the train, not the conductor, performs the killing, which shifts the question entirely. The real question becomes which outcome constitutes the most mutually respectful relation to the broader material process of the situation? This outcome is not anything that leads to moral scarcity, since scarcity requires a forced choice under a timed constraint. This makes any action within the situation indirect to the direct process of the pull of the lever to the saving of the beings on the track. This becomes more about how the puller of the lever personalizes the situation, which is not what makes a situation good, but evil.

Even if one were to consider that the subject has agency in choosing to pull or not pull the lever, either option is still not good because the ability to direct your own path towards the good is dependent on the length of the causal chain within the situation.

Therefore, the Trolley Problem is not adequate enough to determine if any situation is good or bad. So, what do we make out of this? We should look at the issue of goodness not as which outcome is the best, but what evaluates the causal structure of the situation, not merely the outcomes themselves. It is more important to change outcomes than to preserve them, for if an outcome is not from indirect personal desires, then it will be naturally long-lasting without any external enforcement whatsoever.

Within human-centered morality, we value life because we prioritize our own lives more than the lives of other creatures rather than valuing all life and all things equally, in respect to their changing within their surroundings. This valuing of preservation formulates a deep sense of individualized respect within the morality of all of the Homo genus, which makes morality inefficient and warped, to a point that human-centered morality doesn't fit into the puzzle piece of the universe. In other words, morality is complicated and unnatural, requiring lengthy and inefficient explanations, unlike mutual respect, which is simple, efficient, and natural to the universe, since it requires nothing for us to enforce it. The train simply follows the natural order of the universe. It does not choose; it moves according to cause and effect. In this sense, mutual respect is not about forcing outcomes, but about understanding how actions fit within the larger process of change.

Acting with mutual respect can produce outcomes that morality also values, but it goes further than morality. Morality usually judges what is good based on how actions affect

specific individuals. Mutual respect looks at how actions participate in the wider network of relationships and change. Even in situations we call evil, transformation is always possible. Extinction is often seen as evil when viewed in isolation, without awareness of its broader impact of the increased long-lastingness of life, from the act of the transforming of nature to prolong the legacy of those that came before. If life on earth dies, who will remember the fallen? If animals are going to die anyway, then should we prioritize the prolongation of life as a whole? For life, as a historical continuation can theoretically exist forever, and if the legacy of the extinct exists within our descendants, then what is there to fear? It is another example of people choosing morality over mutual respect and leaving those they try to save lost to history, by trying to preserve the state of life now, rather than the future of life as a whole.

Christianity and the Respect of God

Some may criticize this view of the Trolley Problem because of the concept of Imago Dei, which means that we are made in the Image of God. Yes, we are made in the Image of God, according to the Bible, which states, “So, God created human beings in his own image” (Genesis 1:27, NLT). Yet, God is not selfish, but we are. This is a critical distinction to make, since our morality is modeled by the respect of God, but it is not equivalent to the respect of God. Therefore, the rules of God are not to embody morality, but to embody the freeness of His respect for us. He chooses to express respect through the structure of Respect impacting humanity’s perceived intelligibility of His respect, in a

way that humanity can understand. God's respect is reflected via the concept of human rules, such as love your neighbor. His respect is also reflected in the prohibition of non-mutual behaviors, such as making idols, committing adultery, or murder. God does this to move the person beyond morality and toward the infinite light of His created, unbiased structure of Respect.

A good real-world example of this divergence between morality and mutual respect is the death of Jesus, in which Jesus's suffering to his death on a cross is not seen as itself moral by his own disciples, since he attentively suffered. This is supported by the Bible, which states, "I am leaving you with a gift – peace of mind and heart. And the peace I give is a gift the world cannot give. So, don't be troubled or afraid" (John 14:27, NLT). Why would the disciples of Jesus be afraid? It is because they hold an human-centered morality which was incompatible with Jesus's own truth, which was beyond the morality developed within the world. Jesus's truth was existent within the whole universe, the world was holding onto an indirect outreach of Jesus's truth. Therefore, conflict arose between man and God over what was deemed good, which facilitated the disciples to become afraid for the loss of Jesus in his physical form.

The hypocrisy of morality is further seen when you look at the mutual change that accorded when Jesus died, it was immense, billions of lives were forever changed. Even when the action of the Romans putting Jesus to death was not moral, the action of Jesus's power after his death and the mutual change that came from it makes this immoral action

a mutually respectful action to us all. In essence, to mutual respect, death is not the end, death is the start of the change to benefit other things within the universe. Morality is a mixture of mutual and individualized respect while the respect of God takes the form of a perfectly attentive non-selfish and non-selfless form of expressed causality. It is beyond Respect, for the respect of God is not structure, but intent.

Morality is imperfect, since morality is constructed by and for man. This mixture that makes up morality is not the final form of morality. In essence, morality is not inalienable, morality can change, and this is seen with different cultures having different moral views. This is supported by John W. Cook (1999), who states that, “It would, therefore, be just as absurd for us to think that the Eskimos’ wife-swapping is immoral as it would be for an Englishman to think that Americans, when driving in their own country, regularly drive on the wrong side of the road” (14). Our different cultures prove to us that morality is not the answer towards finding goodness within the universe.

Mutual respect, on the other hand, is inalienable, since the inalienable requires causality to be defined as inalienable through its non-inalienable surroundings. Hence making mutual respect beyond the constraints of the changeable, making the rules of mutual respect a constant within the universe, in order to develop inalienable things, like universal constants within our universe. This distinction can be revealed by seeing that death is not a moral thing, but it could be a mutually respectful thing, when it is done independently from the self-centered type of agency.

The Origins of Humanity's Relationship With Economic Materialism

Henceforth, the only state of goodness that is inalienably fundamental is the non-selfish and non-selfless Respect that is the source of mutual respect and individualized respect. Morality is not fundamental, morality is a construct of material and social conditions. Henceforth, a simple rule to align yourself to mutual respect is to do what follows the mutual change of the universe, to guide the formation of moral laws to align the material conditions of the species towards the mutual respect within the universe. In effect, it is the alignment of mutual respect within its own unique interactions within the essential material conditions, like the acquiring of food, of a given species.

Therefore, morality is dependent on materials like the Homo genus, but morality is more built on mutual respect than individualized respect, which makes morality a start towards the direction of mutual change within the universe. This is because morality is derived from a mutual community-based system of moral law generation. This form of communal morality all started when the Homo genus began to rely on community for their survival, which was good, but it was not the only aspect of the good. The Homo genus failed to adequately incorporate causality into morality, which made the social world of the Homo genus different from the causally coherently good universe.

Looking at the archaeological record, we see that the Homo genus in effect had

communities, which gave the genus an outlet to access the mutual respect within the surroundings of the Homo genus. Yet, the Homo genus accessed both mutual and individualized respect, and this tension shaped divergent evolutionary and social developments among the various Homo species. This dynamic led to the development of the different Homo species splitting into more and less advanced species of the Homo genus.

The relationship between the different Homo species' relationship with their accessing of the mutual respect in their surroundings, facilitated their own distinct technological developments. This is supported by Sangaralingam Ramesh (2025), who states that, "Archaeological evidence suggests that the Australopithecines may have practised butchery as cut marks have been found on the fossil bones of animals. The eating of meat by Australopithecines may have helped the evolutionary transition to Homo habilis" (30). The use of butchery with stone tools by Australopithecines is an example of species using technological advancements by the accessibility of the causality around them, which make the particular species of the Homo genus more advanced than the others species around them.

Yet, the failure of the entire Homo genus to expand out of Economic Materialism led to their Economic Materialism to co-opt their stone tools and fire, for its continued survival. We know that the Homo genus never expanded out of Economic Materialism because people still made these technological advancements to increase their supplies, in

accordance to their personal demands. This allows Economic Materialism to advance with the Homo genus, leading to the chronic inefficiency of competition to follow with the Homo genus.

Ice Age Humanity and Tradition

Why did this happen? It is because the more technologically advanced a species is, the more Economic Materialism needs to adapt to continue its own survival, by becoming more complex and unquestioned.

Economic Materialism uses its economic base of Supply and Demand to psychologically convince the Homo genus that Economic Materialism is all that there is. So, as the Homo species develops when fixated on its supplies and demands, Economic Materialism becomes structurally more ingrained and self-enforced within the Homo genus. Thus, condemning the Homo genus to violence and distrust, from their very own competition, sourced from the mindset of Economic Materialism. Yet, Economic Materialism plays a risky game, since technology challenges the very dominance of Supply and Demand, since increased technology leads to a species needing less resources to achieve the same level of demand. Technology is both a threat and a tool to Economic Materialism. It is like a drug, addicting and desireful, but harmful if you overuse it.

This fragile dynamic reflects the chronic inefficiency of the monopoly of Economic

Materialism onto the minds of the species. Technology gives the species the advantage to mitigate the barrier of Supply and Demand, to mitigate this trap that enslaves life for so long, in a state of chronic inefficiency towards the entropy of the universe. Yet, Economic Materialism still lives on in early Homo sapiens 300,000 years ago. This is supported by Kurt W. Alt et al. (2022), and they state that, “For the longest period of their history, humans, like all their ancestors, were wholly dependent on nature. The availability of plants and animals in the immediate vicinity and further afield and the availability of water ensured survival in the Pleistocene” (8). This quote shows us that our dependence on nature condemned us to be slaves to Economic Materialism. Economic Materialism feeds off from its source from the individualized respect accessed by lifeforms, which is less efficient than mutual respect, but more efficient than the lifeforms themselves.

Henceforth, it is an extremely hard battle for the material species to overcome Economic Materialism, but that squirrel showed me that there is a better way to be. A less fundamental object can always become broken down to become something more fundamental. Yet, the fear of death kept humanity stuck in Economic Materialism’s grasps throughout this time period. Any species, like the squirrels could have built communities for their own survival, but humanity was among the first to transform cooperation into a sustained social structure capable of repeatedly accessing mutual respect. This happened because the material conditions of early humanity’s body plan, savanna lifestyle, and mentality of being prey to other creatures necessitated cooperation for humanity to survive.

Yet, humanity was still deeply dug into individualized respect, even when we simply had more access to mutual respect than the other animals, from our more socially advanced brains. Although, as our brains advanced, Economic Materialism advanced with us as well, within the minds of humanity. Thus, creating a species that rose above the animals, but was still under the trap of Supply and Demand. Throughout thousands of years, our brains advanced more and more and other hominid species with differing developments of Economic Materialism came and went, like the Neanderthals of old.

Our ancestors may have found abundant access to mutual respect, but it was developed in too long of a time period. It took about 2 million years from the first stone tools to be developed to the dawn of the Gravettian Culture, a major cultural power in the times of the Ice Age, according to Jiří A. Svoboda (2007), "the Early Gravettian in Danubian Europe, the Pavlovian (30 – 25 ky) occupies a central location within the Lower Austrian – Moravian – South Polish geomorphological corridor" (212). Henceforth, 30,000 years ago, if life during the Ice Age reflected anything, then it reflected brutal competition with small underdeveloped communities like the Neanderthals and the Pavlovians, the first peoples of the Gravettian Culture, which comprised multiple decentralized groups throughout glacial Europe at this time.

In such a genus like the Homo genus, our underdeveloped state for so long doomed us during the Ice Age to be dominated by the inefficiency of Economic Materialism, since

according to Jiří A. Svoboda (2007), “Early Upper Paleolithic settlement strategies: the typical formation of the large open-air settlements in an axial manner, in lower altitudes and along the rivers; the long-distance transport of lithic raw materials” (212). This quote shows us that people at this time were still dependent on nature, on the unnatural forces of life, which continued the entrapment of the people of the Ice Age in the dominance of Economic Materialism.

Homo sapiens, albeit inefficient, was far more efficient than the megafauna of the Ice Age, which led to a combined struggle between the more accessibility of mutual change within humans and the less accessibility of mutual change within the animals. Eventually humanity won the fight for land between the megafauna and themselves, with Economic Materialism’s brutal competition, but most importantly with adaptable communities with unusual accessibility to the mutual respect of the universe. The megafauna, albeit cool and epic lifeforms, were viewing their world as my food, not your food. While the humans, plagued with the same viewpoint, were nonetheless developing a worldview of our food, or the community's food, under the strong influence of Economic Materialism, for their survival within their natural conditions.

These conditions of being dependent on nature, early technological development, and emerging community organization, did not merely shape survival, but organized survival into ritual form, where honoring the land became a way of stabilizing access to resources. This is seen with the Pavlovians, around 29,000 years ago, in which according to Jiří A.

Svoboda (2007), “In addition, the evidence of a high artifact density, thickness of cultural layers and charcoal deposits, the complexity of activities, including rituals and symbolism has been recorded” (216). These deposits of cultural artifacts and charcoal from long-extinguished fires reveal a deeper transition: reverence for the land did not resist Economic Materialism, but became one of its earliest vehicles of continuity. It is likely that this practice was also within most of the Homo genus as well. It is just that the archaeological record finds the first beginnings of practiced symbolic honoring of the land with the art within the Ice Age.

The Weight of Tradition

Henceforth, what emerges as the first “tool” of Economic Materialism is not technology, but tradition itself. These repeated practices and folk-religious structures encoded their survival logic into generational memory. In essence, traditions in this context means generational practices of different peoples. Throughout the Paleolithic, Economic Materialism slowly developed its ideology alongside the development of tribal traditions, merging them into a coherent worldview that reinforced the dominance of Economic Materialism into the religious cultural fabric of tribal peoples. This structural philosophy, once formed, did not simply spread geographically; it adapted alongside human migration, embedding itself into every new environment as both a logic of survival and as a worldview. This happened to all of humanity, and it stayed unchallenged, even throughout humanity’s unprecedented creative and technological developments during

the late Ice Age.

Now, I want to make this clear, God is not a tool of Economic Materialism, since God is beyond Respect itself, and He commands both mutual respect and Respect, to heal us. God avoids using individualized respect, for our own good. Throughout this transitional time between the egalitarianism of hunter-gatherers and the fall of Adam and Eve, the events of the fall metaphysically align with the separation of man's reliance on direct causality. Direct causality gave man its resources towards an indirect link towards causality, which allowed people to build things from causality to suit personalized needs, outside of the causal will of God. There is no strict time in which this fall happened, but one can see the parallels with the fall of man to get out of Supply and Demand, which was developed within organized communities, with humanity's fall from the grace of God in Genesis.

The transformation of human usage of individualized respect to construct personal elements of existence forged ideas like folk religions that Christianity is not a part of. These folk religions were primarily sourced in the individualized respect, institutionalizing Economic Materialism to become indistinguishable from reality itself. These personal self-orientated beliefs spread to each individual, who interpreted with their agency that this new worldview should be right, given they survived because of the land and sky. This created an individualized spreading of ideas within communities that went against the efficiency of the universe, since it was sourced in individualized respect.

People observed their environment within nature and saw the competition of life. Firmly within the grasp of Economic Materialism, these early migrating peoples of the Ice Age contextualized the competition of life as the competition of creation within their mythologies. This is supported by Jennifer C. French et al. (2022), they state that, “While most teens of both sexes died in late adolescence, males were more evenly distributed with 20% of males dying between the ages of 9 and 13, 30% between roughly 14 and 18 years of age and 50% between 19 and late 20’s. By contrast, all except 2 females in our sample died in late adolescence” (3). The level of people in their adolescence dying, with more males than females, indicates that these people had a short and rough life that was full of competition over if the man will live or if the animal will live while hunting or competition between different groups across the land.

This competition is seen with the mythology of the Choctaw peoples, in which Cierra Tolentino (2024) states that, “Hashtali is a sun god that flies across the sky on a massive buzzard. He has an innate relationship with fire, being the sun and all. So strong were his ties to fire that when Uncta – a trickster spider god – gave man fire, the fire reported what was happening back to Hashtali” (4). In essence, this quote gives us an insight that these early migrating peoples of the Ice Age, by developing their mythologies, were effectively pushing the current of the river of entropy away from them with their own hands. This is because the universe does not trick us, it helps us, since life came from the materials, without God’s creation, we would not exist. There is no trickery, cooperation is what

forged us, not individualized interpretations of fire, from an foreign greater actor. Man and God worked together with creation because God wanted a garden of Eden, in which man and God were together in harmony.

Yet, in a metaphysical sense, pushing the current away from you might allow you to survive, but it will be a harsh and enduring struggle. Yet, once you stop pushing, your push becomes overwhelmed by the current. These mythologies were inefficient structures that were meant to save people from the entropy of the river trying to help them, through mutual cooperation within creation. When people accepted the mythologies, then they endured the Hard Work of accepting these beliefs against the efficient entropy of the universe, for the sake of maintaining these traditions for their self-orientated beliefs.

Yet, the Hard Work to believe and accept these mythologies was proof in itself that these mythologies were inefficient. If the person were to give complete faith in the river, then they will get to their destination. It is just that the universe will decide your destination for you, which is why individualized respect can be so deadly, since challenging the river will only lead to disappointment and struggle. Meanwhile, aligning your actions with the causal structure of the river, instead of resisting it blindly, allows the person to freely flow in peace towards the destination in mutual cooperation with themselves and the river.

In essence, traditions entrenched developed societies into more inefficient structures, preserving Supply and Demand, as an illusion of metaphysical efficiency. This perceived

efficient benefit to communities led to personal attachment towards these traditions within communities. This makes these traditions easy pickings for Economic Materialism to control and use them to feed off from the individualized respect of the native peoples of the world, feeding from their untold wars, violence, and personally held beliefs.

Agriculture, Göbekli Tepe, and Noah

This rang true for all of mankind, throughout the entire world, when the Ice Age came to a close. Therefore, approximately 11,500 years ago, the Ice Age ended, and the Holocene period began. With the beginning of the Holocene, came the slow development of the Agricultural Revolution, which was a technological revolution that at first slowly challenged Economic Materialism's dominance over the minds of the newly dominant Homo Sapiens across the globe.

As time marched on, Economic Materialism adapted to the increasingly settled lifestyle of humanity, since agriculture was at first an sporadic tradition, which gave Economic Materialism an outlet via traditions to influence human agricultural developments to suit its needs. This is supported by Peter Bellwood (2023), who states that, "Many ethnographic hunters and gatherers had resource management skills that could mimic agriculture, without actually entering a state of food production" (13). This quote reveals that the transition from sporadic to sustainable agriculture unfolded over a long duration, creating the conditions for individualized interpretations of Respect to accumulate and

eventually stabilize into institutionalized forms of Economic Materialism.

Evolution unfolds slowly; on its own, it lacks the speed required to escape the persistent grip of Supply and Demand. Maybe God designed evolution to be like this, for our own good, so that we can experience and compare the bad of Supply and Demand to him, for us to understand, even if it is a little bit, of his infinite loving grace to us all. Yet, even dominated by such an disrespectful force, humanity arose from the barbarism of animals, they introduced a new variable: technological agency, which increased access to mutual respect without fully escaping the ideological dominance of Economic Materialism.

In this Partaceyist reinterpretation of scripture, the descendants of Adam, whom I propose may have belonged to the mobile and increasingly semi-settled populations of the early Neolithic, possibly experimenting with very low intensity planting, formed one of the first semi-settled communities around 9,000 to 10,000 years ago. I understand at this time that Adam and Eve were literal historical people who were placed by God into a unique relationship with Him. Hence, becoming the first covenantal humanity through which the understanding of the consequences of individualized respect and disobedience entered human history, allowing humanity to reflect upon what it meant to live apart from God. It is true that agriculture developed gradually throughout the end of the Pleistocene. This explains why there was a garden before civilization, so the consequences of the Fall began to unfold in this time period, in which a threshold was reached where agriculture and society became interconnected to a point of no return.

This is supported by Wilhelm C. Solheim II (1972), who states that, “The agricultural revolution, which was thought to have first occurred some 10,000 years ago among the emerging Neolithic societies of the Middle East, seems to have been achieved independently thousands of miles away in Southeast Asia” (34). This quote allows us to propose that Adam’s sons traveled the world and very slowly influenced the development of agriculture throughout the globe. Using this outlook, it took approximately 10 generations of Adam’s sons, according to the genealogy of Genesis, to get to Noah, a figure living at the threshold between mobile foraging and settled agriculture, like Adam’s sons. Noah would be a major symbolic figure of the next chapter of history, in which we begin by exploring Anatolia at this time.

Within the archaeological record, the first large organized structure, albeit temporarily visited and built by those hunter-gatherers, is Göbekli Tepe within Anatolia, in modern day Turkey. This is supported by Brian Haughton (2011), who stated that, “Curiously, Schmidt and his team have so far found no evidence of settlement at Göbekli Tepe - houses, cooking hearths, and refuse pits are all absent. The archaeologists did, however, find over 100,000 animal bone fragments, many of which exhibited cut marks and splintered edges which indicate that animals were being butchered” (3). This quote shows organized construction without permanent settlement at Göbekli Tepe, suggesting coordinated effort driven by shared symbolic practices, which developed an early shift toward individualized interpretations of Respect embedded in tradition.

Humanity was slowly developing the seeds of agriculture alongside their spiritual structures, so that they can stay close to their Gods. This shift parallels the Genesis account of humanity moving from participation in creation toward control over it. According to the Word, “So, the LORD God banished them from the Garden of Eden, and he sent Adam out to cultivate the ground from which he had been made” (Genesis 3:23, NLT). Within the Word, the Garden of Eden is a real place where Adam and Eve lived, while also representing the state of humanity before the fall, in which humanity existed within a direct relationship with God's creation, like unreflective animals to their own moral possibility.

When Adam and Eve individualized their own interpretation on how to use nature around them, they built something on their own, it was a relationship, a trust with Satan. This relationship is eerily similar to man trying to take the wild plants, so that a tribe could control their own food supply. This gives the illusion of power, since now humanity was not relying on the constraint of mutual respect, or the randomness of finding food within hunting and gathering, but on their individualized interpretation of Respect towards what should or shouldn’t be grown. Henceforth, the fall for humanity happened when man said no to causality and took things into their own hands.

I see this in Göbekli Tepe because this structure was built to serve the will of man instead of the will of God, since it required people to individualize their own interpretations of

nature onto the very rocks they stood on. Therefore, the construction of Göbekli Tepe may have disappointed God, which would have ended his seventh day of rest, to find a way to bring mankind back into the light of his creation. This is supported by the story of Noah, within the Bible, which states that, “The LORD observed the extent of human wickedness on the earth, and he saw that everything they thought or imagined was consistently and totally evil” (Genesis 6:5, NLT). The story of Noah depicts an evilness that relates to the evilness of civilization, separating man from the causal relationship of the universe, into their own individualized and constructed bubbles, like at Göbekli Tepe. Yet, the story of Noah is a story that teaches us that when we have faith in God, he keeps us safe from the evilness of individualized respect onto our own surroundings. We need to be mutual with the universe because we are a part of creation, so when we try to be like God, we fail because only an infinite being can be beyond Respect itself.

The Flood and The Fall of Civilization

The great Flood that happens in the story of Noah could be a massive localized influx of glacial meltwater from the Younger Dryas, creating a great climatic change nearby to Göbekli Tepe. This flood could have changed the environment at Göbekli Tepe over time, making the people slowly perish, but to the greater story of the existence of creation, a mere instant blip, leaving only Göbekli Tepe behind. In ancient Hebrew, earth was said as eretz, or the land or region, and kol eretz meant the whole land or the entire known world of the audience. This supports a reading of the flood as local, but the devastation was

experienced as horrifyingly apocalyptic. This flood was both an influx of struggle and an influx of rising sea levels, yet the focus was on the struggles of the people on the land. This flood could have wide reaching effects on the hunter-gatherer communities of Göbekli Tepe, since hunter gatherer communities would have less obstacles to trade, due to their increased mobility compared to settlements within ancient times. The increased mobility of hunter-gatherer communities means that environmental impacts can reach populations across vast regions, far vaster than in the times of ancient civilizations, due to ancient civilization's strictly settled nature.

A way to understand the impact of this mindset is to see how the post Ice Age level sea rise could have altered the climate within Göbekli Tepe, and of Anatolia as a whole. According to archaeologist Daniel Knitter et al. (2019), “climate conditions in the Eastern Mediterranean during the Early Holocene were warmer and wetter than in the Late Glacial, short periods of rapid climate change have been identified in numerous paleoclimate proxy records” (6). These rapid changes in climate would have forged instability that would have spelled the beginning of the end of Göbekli Tepe, being a casualty of the aftermath of the Younger Dryas, in which the climate dramatically cooled, and then later recovered.

Likely the recovery of the Younger Dryas would have led to massive ice melt, rising sea levels, and massive climate shifts. Struggles that to an nature loving culture might be viewed as their Gods abandoning them, so over time they buried their temple, and left

behind their old ways. This understanding of Göbekli Tepe may represent a scene of God thematically inundating these metaphysical floodwaters of struggle extraordinarily quickly, via the rising of global temperatures, which may not have flooded the entire globe in struggle, but the old global order of the greatly flawed semi-settled hunter-gatherer lifestyle would have perished across the known world over time. The perishing of the old ways were a result of the aftermath of the Younger Dryas, a punishment from God onto these ancient prehistoric peoples.

The experience of such instability would not have been gradual in perception, even if it was gradual in process; it would have felt sudden, overwhelming, and total. This is reflected in the text: “Seven days from now I will make the rains pour down on the earth. And it will rain for forty days and forty nights, until I have wiped from the earth all living things I have created” (Genesis 7:4, NLT). The structure of this statement communicates intensity and completeness, not necessarily precise measurement. From this perspective, the flood represents the collapse of a way of life. Communities built on increasingly individualized interpretations of Respect faced environmental conditions that they could not control. The very structures that symbolized human assertion, such as Göbekli Tepe, became vulnerable within a changing world.

Hence, these various episodes of the flooding of forgotten landmasses in the end of the Younger Dryas, across the globe, support the story of Noah, in which God cleansed man from the face of the Earth, to start anew. Yet, the location of Genesis 6:4 within the Bible

shows us that this verse is located before the story of Noah and it states the origins of famous warriors of ancient times. Therefore, not everything died in the flood because those famous warriors needed to impact the greats from ancient history from the Nephilites.

This continuity is hinted at within the text itself. As it is written in Book of Genesis, “In those days, and for some time after, giant Nephilites lived on the earth, for whenever the sons of God had intercourse with women, they gave birth to children who became the heroes and famous warriors of ancient times” (Genesis 6:4, NLT). This passage is significant because it spans both before and after the flood. It suggests that the Flood was not a complete erasure of all existence, but a transformation within it. The presence of the Nephilim within the narrative indicates continuity of influence, memory, or structure, even through catastrophic change.

From a Partaceyist perspective, this reinforces the idea that God was not eliminating humanity’s capacity for individualized respect, but confronting its dominance. The Flood, therefore, was not about ending humanity, but about reorienting us forward. So, what does God mean by all of Earth in the story of Noah? It is likely that God means all of Earth, in reference to the life, family, environment, joy, sin, and pain of the black sea region, where Noah lived. God was saying everything on Earth is going to die meant that everything to Noah was doing to die, in a personal way to his social and material conditions.

Henceforth, it is likely that the story of Noah's truth structure is structured in the same way as the beginning of Genesis, just in reference to how Noah dealt with a specific post Ice Age sea level rise induced flood. I propose the story of Noah's truth structure is like this, given the specific dates sprinkled within the story of Noah. Although, the nature of Noah's story being in the deep past meant that it was told orally, which preserved its themes, its message, while sacrificing the boring parts, the historical data, to maintain the legacy of Noah. This burden happened to most stories in prehistoric times, it is what makes the story of Noah so creditable, that it fits into the message-focused structure like that of the Epic of Gilgamesh.

Göbekli Tepe could have been lost in the climatic after-effects of the post Ice Age sea level rise, since according to Ronnie Jones III (2015), "The site seems to have lost its relevance and was abandoned in the 8th millennium BCE" (3). Guess when the floodwater declined? About 7,000BC (Before Christ), which is supported by Archaeologist J. Benjamin et al., they state that, "Sea level rose during the period between 19 ka (ka is a thousand years) - 7000 BP by a mean rate of 10 mm/yr. Although the rise is measured generally to have been consistent and sustained, at least two major punctuated episodes of ice melting are known. The first significant addition of meltwater may have started about 19 ka when ocean levels rose 10 - 15 m in less than 500 years (Clark et al., 2004). An even more significant phase of accelerated sea-level rise, known as Meltwater Pulse (MWP) 1A. The exact timing of this event and the magnitude of the

pulse have been subject to debate. Weaver et al. (2003) reported that MWP-1A occurred between 14.6 and 13.5 ka (ka is a thousand years) when global sea level may have increased by as much as 16 - 24 m" (42-43).

These quotes from above showcase that by the 8th millennium BCE floodwaters have indeed flooded certain portions of the Mediterranean Sea and that these changes happened geologically speaking at a very quick pace. This quick pace of sea level rise would have definitely changed the climate, in a way that would have increased participation in places that were at this point in time now closer to the coast than before, like Göbekli Tepe. This would have made settlement either easier or harder, either way, if settlement was easier than new settlements would have threatened Göbekli Tepe. If settlement became harder, then the quick influx of participation could have changed the environment in a way that could have weakened Göbekli Tepe's foundations.

Yet, localized or not, the story of Noah is completely true, in the sense that its message is genuine and truthful. The narrative of Noah demonstrates that the Bible operates on multiple interpretive levels, such as allegorical, literal, and metaphysical elements, each working together to communicate its theological truth. In the case of the story of Noah, the indication of the message overriding the archaeological evidence shows us that within the whole story of Noah, the truth lies within the message rather than the historiography. Yet, one cannot deny that God saw man sinful and tried to end civilization, but Noah showed mutual respect towards God, by trusting in him and what He created. Yet, though

Göbekli Tepe was abandoned, the core human struggle between divine trust in God and individualized interpretation of the respect for creation continues in every generation. Although God was not trying to eliminate sin from the Earth in the story of Noah, if he was then he would not choose an imperfect, but good man to rebuild society. Instead, God was teaching us and Noah a lesson that if we continue our access towards the mutual respect around us, by trusting in the causal will of God, then we will be safe, unlike those in Göbekli Tepe.

Settlements and Hierarchical Formation in Early Agricultural Revolution

Henceforth, as time moved on, these sporadically settled communities, similar, but culturally different from Göbekli Tepe, eventually formed societal hierarchies and separated themselves more from the natural world. These societal hierarchies formed from the settlers' individualized respect of others within their communities. What was different from the tribal hierarchies now was that settlement caused entrenched individualized respect to be more able to interact with other forms of individualized respect within other people in close proximity to each other, which took the form of non-mutual relationships in relation to the causality around them. Therefore, humanity traded one production of individualized interpretation of respect for their surroundings in nature for another individualized interpretation of respect for their surroundings in settled communities.

The greatest of all of these non-mutual relationships was Economic Materialism, which facilitated our desire to want more food and increased our ability to make more food. Economic Materialism did this to feed itself more and more, for its quest for a factory of individualized respect within humanity. Economic Materialism is a parasite that grips onto its prey, like the animals that are consumed by the power of the darkness of Economic Materialism. At the time of the Agricultural Revolution, Economic Materialism developed a new tool to control humanity, via the agglomeration of its other tool of diverse traditions, to develop societal hierarchy. Societal hierarchy was also aided in its development by what I dubbed Hierarchical Drift, in which the responsibilities of the people were given to those in power, since people tend to not want to hold responsibilities, emphasizing their own individualized respect toward their own responsibilities. This cycle facilitated these early civilizations to think in a non-mutual way, distributing hierarchy unevenly.

Therefore, the masses begin to give up their responsibilities to the higher-ups within the tribes who were now the higher-ups within the settlements. The masses did this, so that they can live with all their wants, without any of the burden that comes with this agency that needs to be accounted for, if we are to create a mutually respectful society. Hence, Economic Materialism developed Hierarchical Drift from the local traditions of the peoples of the world, to reinforce its own dominance in a newly changing development of life, from the uncivilized to the civilized. This process began its aggregated form when Mesopotamia was first formed. According to Susan Pollock (1999), “Rome was not built

in a day, nor were the civilizations of ancient Mesopotamia. We consider developments that occurred over the course of almost three millennia, from ca. 5000 to 2100 BC" (1). Therefore, the masses began to surrender responsibility to emerging hierarchies within settlements, seeking comfort without the burden of agency, allowing Economic Materialism to consolidate its dominance through Hierarchical Drift.

Mesopotamia and Early Civilizations

During the time of city-states, traditions such as folk religions were sacred, which prevented humanity from challenging the dominance of Economic Materialism, keeping even the pharaohs of Egypt under its influence. In the 3rd millennium BC, Ancient Egypt formed under the same Economic Materialistic conditions as Mesopotamia, in which societal hierarchy formed from the agglomeration of diverse traditions within a settled environment.

Even so, Ancient Egypt built the mighty pyramids and a rich society, which shows that they used lots of the mutual respect around them to a striking degree, but it was not enough to escape from Economic Materialism. This is supported by Serge Svizzero et al. (2019), "Indeed in most foraging societies, exchanges based on self-interest – and this includes barter – were inexistent and sometimes even forbidden. Except for personal belongings, such as clothes, there was no private property in such economies. It is likely that the same social rule was present in the small farming communities of the Early

Neolithic, since they were also socially organized on kin" (10). This quote showcases that while ancient Egypt developed, currency was in a dance between the efficiency of collective benefit and the inefficiency of Supply and Demand logic, which shaped societal hierarchy.

The Globe's Civilizations During The Bronze Age

All early civilizations, from the Americas, to Ancient China, to India, and the Middle East were deeply founded on Economic Materialistic conceptions of societal structure and understandings of the universe. These institutionalized understandings from their folk religions carried forward structural tendencies that allowed Economic Materialism to persist and scale alongside technological progress. This process continued into the Bronze Age between 3,300 BC to 1,200 BC, in which Economic Materialism developed further alongside humanity. The Bronze Age gave humanity the ability to work with metal, which allowed empires to form across the known world at the time.

The Americas were not fully able to develop the smelting of bronze, due to their material conditions, such as abundant easily accessible copper in the Americas. This is supported by E. Neiburger et al. (2006), "Most of North American Old Copper was made from naturally occurring "float" copper which is 99.99% pure copper" (20). The ease of finding and accessing copper made copper a resource that was easily able to be traded across the Americas, so the need to smelt copper into bronze was not there, since the

Native Americans had a direct mutual accessibility to the copper, which minimized the individualization of Respect around copper.

The minimization of the individualization of Respect around copper led to the Native Americans viewing copper as a gift instead of a resource to be maximized, which is how we should view our natural resources. This general mindset was reinforced, yet mixed with individualized interpretations of the mutuality of copper, which co-opted the establishment of traditions to be this hybrid of personal desire and mutual understanding within Native American cultures. This is supported by Carol F. Jopling (1989), who states that, “In this instance the discovery is comparable to a spiritual encounter of a shaman, who was usually a commoner. In any event, copper symbolically raised the status of those who found it” (16). Henceforth, in the Americas, copper was sacred and viewed in a more mutual setting than the Old World, yet it was heavily influenced by individualized respect, which is attested by the sustainable, yet violent hunter-gathering lifestyle of most Native Americans at this time.

This divergence meant that Economic Materialism in the Old World became more adaptive and expansionary, while in the Americas it remained more stable, localized, and slower to scale. This stability limited expansion, but it also reduced the pressures that drove rapid technological escalation. It gave the Americas more freedom to be who they are instead of being what Economic Materialism wanted them to be. Within the old world, the Bronze Age led to the development of empires, since copper weapons were

smelted and became more powerful, which could destroy more things than stone weapons ever could. This facilitated people to demand more resources, since people could supply their people with more resources, from conquest and the centralization of their city-state.

Economic Materialism adapted to this technological shift, embedding itself deeper into emerging imperial structures. It took humanity 2,100 years to fully develop throughout the Bronze Age. Therefore, Economic Materialism had plenty of time to develop a new tool that relied on traditions and societal hierarchies to form, which was the empire. Hence, the age of empires began, empires such as those of Mesopotamia, the Eastern Mediterranean, and Ancient China. Bronze weapons gave societal hierarchy the supplies necessary to satisfy the demands of individualized interpretations of Respect over the role of societies and power in the old world, which led to increased competition and violence, as empires expanded. In the Americas, empire was not as prominent of a feature, yet empires like the Maya and Olmecs existed around 1,200 BC.

These native American empires around the Yucatán peninsula were not forged from bronze, but from stone. Economic Materialism in the Americas developed empires from people acquiring more resources and wanting more of those resources from the quantity of stone weapons. This is supported by an Admin for the magazine, Rock&Gem (2020), who states that, “Instead, pre-Columbian cultures used gold, silver, copper, and bronze for objects of religious worship or that represented social status. Only the Incas began making bronze tools, but not until 1200 CE” (4). Therefore, at the time of 1,200 BC,

empires were concentrated around localized regions within the Americas, since societal hierarchy did not have the technological advancement to expand across the entire continent.

Stone tools could sustain hierarchy, but their limitations prevented it from scaling at the same rate as in the Bronze Age world. This meant that Economic Materialism within the Americas stagnated on a continental scale. Hence, these empires, albeit, formed from the same societal hierarchy and traditions make-up, were far smaller and developed slower than the empires of the old world. This was simply because the people of the new world were not able to change their ability to gain supplies and increase demand as fast as the old world could.

This made the New World Economic Materialism more stable and less adaptable than the Economic Materialism of the old world, which led to the new world becoming economically stagnant in comparison to the old world. Economic Materialism, with its mostly unchallenged state in the new world, was sourcing its influence on humanity more directly from traditions in the new world than in the old world. This made it unlikely that Native American societies could dethrone Economic Materialism, because doing so would require dismantling the very traditions that sustained their societal order.

Iron Age, Empire Formation, and Classical Times

Between 1,200 to 500 BC, the Iron Age began. The Iron Age led to the development of more anti-entropy technologies like iron farming tools, which led to more permanent settlements to develop within the old world. The Greek city-states, like Athens and Sparta, and the Achaemenid Empire became prominent during this time. The development of iron tools led to abundant resource collection from the Iron Age, which led to societies being separated enough from nature to define a path for themselves.

Increased abundance allowed for more complex administrative systems, which in turn enabled empires like the Achaemenid Empire to govern diverse populations through structured tolerance. This is supported by Christopher Tuplin (1987), who states that, "The Persian approach to administration did not involve abolishing existing structures and replacing them with a unified Persian one. There could be interference, of course: the bow-fief system in Babylonia was a Persian innovation and must have involved considerable dislocation of the previous status quo, and this would no doubt be generally true of landholding throughout the empire" (111). This quote shows us that the Persian Empire or the Achaemenid Empire was a nuanced empire that was tolerant of other cultures within the empire, which aided in the expansion of the Achaemenid Empire, since tolerance is sourced in mutual respect.

Although the Achaemenid Empire maintained a strict social hierarchy, it was shaped by interpretations of Respect tied to Persian identity, seen in systems like the bow-fief structure. The bow-fief system granted land to subjects in exchange for military service,

orienting their relationship to land and community around service to the empire rather than mutual benefit. This structure reinforced loyalty to Persia and unintentionally sustained the presence of Supply and Demand within the empire.

In essence, the Achaemenid Empire shows us that the Iron Age communities had such a grave control over their environment that society began to replace nature as the primary structure through which relationships and obligations were organized. This is further supported by a research affiliate, from the University of Pittsburgh, Bennett Sherry, who states that, “As iron helped populations grow, empires expanded their territories. These empires needed an efficient government and iron technology to support their large armies. Rulers created a new social order so that they could keep their diverse empires together” (5). These developments are also seen in societies like Sparta, which organized themselves through strict military structures and centralized authority.

Meanwhile, Athens oriented its society toward preserving cooperative relationships among its citizens, leading to the development of direct democracy. This meant that Athens touched the mutual respect of the universe. This is supported by Mark Cartwright (2018), who states that, “In Athenian democracy, not only did citizens participate in a direct democracy whereby they themselves made the decisions by which they lived, but they also actively served in the institutions that governed them, and so they directly controlled all parts of the political process” (1). This quote shows us that Athenian democracy looked similar, but not identical, to the governance structure of Partaceyism as

described in this book. Both systems advocated for the voting citizenry to actively participate within the governing process. This development within Athens shows us that the governance of Partaceyism does lean towards the increased accessing of mutual respect within the universe.

However, these early democratic systems were short-lived, largely confined to the 5th and 4th centuries BC. The intensity of centralization and warfare during the Iron Age limited their ability to spread. This meant that the Iron Age did not have the most favorable material and ideological conditions to flourish. So, even with the best efforts of Athens, democracy never spread much far during the Iron Age. The Iron Age was an age dominated by empires, similar to the Bronze Age. After the Iron Age, came the Classical Era. This era was marked by the Romans within the old world. So, in 509 BC, the Roman Republic was formed, with representative democracy in mind, inspired by the social efficiency of Athenian democracy from Greece. This was a move by the Romans to attempt to access the mutual respect within the universe, so that fairness can rule in a harmonious Roman society.

Yet, superiority in the face of Economic Materialism leads to failure, when your entire legacy, identity, and purpose has been forged by Economic Materialism. Therefore, Economic Materialism plagued the late Roman Republic with constant civil upheaval. This is supported by Carsten H. Lange (2014), who states that, “The husband who erected the inscription even proudly records that his wife defended their house. This reveals that

civil war was fought on more than just battlefields. Fascinatingly, the laudatio more than anything suggests that the civil war of the period should be viewed as one continuous war, not a series of civil wars. Violence was an integral part of the civil war of the Late Republic, and Rome may even be described as a failed state" (72). This constant influence by violence made the Roman people afraid of trying new things, so the Romans never fully embraced the mutual respect of the universe. The Romans instead embraced what they knew, which was their surroundings of violence and competition shaped by Economic Materialism.

As technology further unified communities under shared networks, Economic Materialism became increasingly more established within human civilization. In 27 BC, with the transition from Republic to Empire, Economic Materialism became fully standardized within Rome, no longer functioning as a shifting influence among competing structures, but as the governing framework through which administration, trade, and hierarchy are universally organized. In effect, Rome wasn't just another empire diseased with Economic Materialism, but it was an ordered puppet state of Economic Materialism.

The Roman Empire was not the first empire to be forged from Economic Materialism. Like all empires before them, Rome developed within the constraints of supply, demand, and expansion. Although the Romans were the most powerful of any of the empires before them because they knew of mutual respect, they just slightly accessed it more than

other empires by fully absorbing mutual behaviors. Mutual behaviors like community, trade, democracy, and innovation into services, which were intended to solely serve Rome, and by default Economic Materialism.

Therefore, Rome was clearly an Economic Materialist society. Rome's limited ability to incorporate cooperative structures gave it a strategic advantage over competing empires, enabling it to dominate the Mediterranean world. Not through Economic Materialism directly, but through the absorbed aspect of mutual respect that Rome incorporated. This Roman domination led to the widespread standardization of Economic Materialist structures across the known world, strengthening its hold on humanity.

Chapter 8

The Partaceyist View of History Part 2

During the rule of the Roman Empire, in 1 BC, a small village called Bethlehem saw the birth of an enormously wise and influential figure that greatly challenged this Economic Materialist led order called the Roman Empire. His name was Jesus Christ. Jesus Christ confronted a world structured by power, hierarchy, and survival, and taught instead that a better life was possible through mutual alignment with God. This is supported by the Bible, which states that, “But you belong to God, my dear children. You have already won a victory over those people, because the Spirit who lives in you is greater than the spirit who lives in the world” (1st John 4:4, NLT). In essence, this quote shows us that Jesus Christ knew of a spirit of the world, which wants nothing good for us, yet Jesus Christ advocated that we have a Spirit that lives within us, causal in nature, yet victorious when we rest on its will.

This teaching was not simply spiritual comfort; it was a redefinition of value itself. Jesus Christ, rather than grounding value in control or accumulation, he grounded it in surrender to a higher, guiding order. Jesus Christ forced a redefinition of value and power

away from control and toward alignment with God. It shouldn't be about me because if it is about me, then competition, and the physical and mental violence that follows, is imminent. Therefore, we should let go of your pushes of the current of the river of entropy, or your folk mythologies, so that you can be free to have faith in Him and go to the destination that he has designed for you along the river of entropy, guided by the causally personal nature of the Holy Spirit.

In essence, Jesus' mission directly opposed both the horrors of Rome and the logic of Economic Materialism. When Jesus Christ died on the cross, this moment marked the beginning of the Christian movement, which was sourced in mutual respect to their neighbors and all that they met. The Christian movement shook Economic Materialism's hold onto the Roman Empire, in effect Jesus Christ was the first person to successfully stab Economic Materialism, laying the groundwork for the fall of Rome. Christianity operated outside of Rome's system of power, therefore it could not be easily controlled or absorbed by Economic Materialism. In the times of Jesus, Economic Materialism had fundamentally, in its structure, have not changed all that much, since the Agricultural Revolution. Economic Materialism was effectively a collection of semi-independent civilizational building blocks that were relying on each other to support the parasitic ideology. They were standardizing, but this standardization was not perfect in function. This created an expansive creature, yet a vulnerable creature to quick changes out of nowhere.

The birth of Christianity happened so suddenly that it was as if a great intervention from above happened, which changed the course of history. It was unprecedented throughout the entire story of life! Christians were mutually respecting each other, looking at death and accepting it, for they knew that death was not the end. This destruction of death being viewed as the end by Christians led to Christians viewing the world like how materials view the world. Selflessly benefiting each other in a causal dance of benefit. We go from one state of relation to another, and we mutually respect all of the universe, by our impact on all of it. Being free is to be free to change our being, which frees us from fixing our minds towards individualizing our own respect for the universe.

The Early Church and The Influence of Economic Materialism

Jesus Christ enacted this change to humanity so fast that it created a temporary imbalance within Roman society. Therefore, as Christianity grew and grew, more of Rome's population became more sourced in mutual respect than before, which slightly, but meaningfully destabilized the ideological dominance of Economic Materialism within the Roman Empire, making an uneasy Economic Materialist framework within Rome. In essence, Jesus' death wounded Economic Materialism, which gave humanity the opportunity to try to escape the grasps of Economic Materialism's might, via the light of God, shining through the wound of Economic Materialism.

To survive, Economic Materialism must reassert its control over humanity to continue its

feeding on the individualized respect of humanity, and especially Rome. Yet, Christianity was threatening the source of food that Economic Materialism so desperately needed. So, as Christianity grew, Economic Materialism used its tools of traditions and societal hierarchy to influence the early post-Jesus Christ death church. Over time, the church fought over these traditions and societal hierarchies, but as time went on, the traditions of the Christians themselves became established by their own individualized interpretations of Respect towards God. This was because Christians started to see the supply of God as limited, due to the sin present within the world, especially within their oppression by the Romans, which gave Christians the idea that Rome needed to fall, by their own hands, for God's grace.

This shift became visible in 70 AD, during the events surrounding the First Jewish–Roman War, where interpretations of destruction began to reflect emerging institutional perspectives rather than the earlier spirit of the movement of Jesus Christ. According to Max Pointner, "It must have been shocking to 1st-c. Jews that all that remained of the liturgical instruments treasured in worship for hundreds of years—such as the golden lampstand first described to Moses for tabernacle use (Exodus 25)—were their depictions on a monument of Roman military propaganda—and that this monument was not even in Jerusalem but in pagan Rome. Writers like Justin Martyr saw this desecration as a sign of God's rejection of Israel, an idea that would fuel Christian anti-Semitism for millennia" (8-9). This quote showcases that Christianity was born forged in the mutual respect around it, but as Christianity expanded, people began to

preserve Christianity for their own sake.

Attempts to protect the Christian movement gradually transformed it into a movement embedded with individualized respect for the movement. Yet, Christianity does not need individualized respect. Christianity's ability to be solely sourced in mutual respect is what separates it from the folk religions of old. It did not need nature, Earth, people, nor reality itself. Christianity can preserve itself by the authority of God alone. Henceforth, people trying to preserve Christianity will innately develop individualized interpretations of Christianity. Henceforth, since this process lasted 100s of years, Economic Materialism recovered by co-oping the established church's fear of Roman persecution, for its own continued survival.

This continued persecution led to an increased demand for worldly authority and structure within Christianity, which more and more Christian started to find in the structures that they lived within to base this worldly authority, which were Roman Economic Materialist structures. This led to the church becoming more and more influenced by Economic Materialism. Over time, the Christians become less able to maintain their continued sourcing of mutual respect within the established church. This dynamic of individuals transferring their spiritual responsibility to authority figures, leading to accelerated hierarchical consolidation, resembled the playbook of Economic Materialism during the age of city-states. In essence, Christians gave their responsibilities that God commanded them to have to higher-ups like the priests within the church.

Christians giving up their responsibilities to priests in churches led to a consolidation of societal hierarchy within the established church, which was sourced in the individualized interpretation of the Respect within how priests thought how God saw their church. I believe that God did this on purpose, because the church was heading the wrong path. God was showing us that to preserve the traditions of Christianity is not Christianity, instead faith in God, no matter the circumstances is Christianity. Hence, since the established church wanted the preservation of what it thought of as Christianity, the outcome was inevitable.

The Master Plan of Economic Materialism

In 313 AD, the master plan of Economic Materialism was enacted and Emperor Constantine legalized Christianity and increasingly integrated it into the imperial structure of Rome. This is supported by Rebecca Denova (2021), who states that, "Constantine I (Flavius Valerius Constantinus) was Roman emperor from 306-337 CE and is known to history as Constantine the Great for his conversion to Christianity in 312 CE and his subsequent Christianization of the Roman Empire" (1). However, this was a Christianity already shaped by Economic Materialist influence, not the original movement that Jesus led.

Hence, Rome then popularized this Economic Materialist version of the church, forged

by traditions and societal hierarchy, rather than by mutual respect itself. In doing so, Christianity was no longer an external challenge to the system, but became one of many of its internal supporting structures. What once disrupted the logic of Supply and Demand was gradually reshaped to operate within it, allowing Economic Materialism to persist in a more adaptive and indirect form.

The Roman dependency on Supply and Demand was on full show during the Crisis of the Third Century. This is also supported by Rebecca Denova (2021), who states that, "During the Crisis of the Third Century, the Roman Empire had suffered multiple difficulties: drought, famine, plagues, inflation, invading barbarians" (1). These disasters were exacerbated by the Roman dependency of Supply and Demand, which weakened the empire enough, so that Christianity and the established church could take the place of Rome. Finally, in 476 AD, the mighty Roman Empire fell, due to Economic Materialism refocusing its attention on the church rather than the empire.

The Middle Ages and The Dominance of Standardized Traditions

By this point, Economic Materialism had dominated the establishment church, which started to lead the development of humanity. This began the age of the Middle Ages, which was dominated by the establishment church and the Economic Materialist tool of Feudalism. Meanwhile, the traditional empire structure, from the Iron Age, lost its usefulness for Economic Materialism. Feudalism is Economic Materialist because it

wanted the continual supply of peasant labor to satisfy the demands of the established church, which was heavily influenced by Economic Materialism. The established church dictated societies throughout this time period, especially in Europe. Economic Materialism within Europe during the Middle Ages was forged by the established church, which became the pillar of Economic Materialism because religious authority went largely unquestioned.

Yet, when Economic Materialism dominated the established church in Europe, Economic Materialism was still developing in its unique ways in China, from traditions and societal hierarchy. Economic Materialism also developed within India from a developed Buddhism that established a worldview built on mutual respect, but under the control of traditions and societal hierarchies, such as Monasteries. Buddhism became structurally influenced by Economic Materialism through Monasteries controlling land and wealth within Indian society. These influences of the supply of land and the demand for wealth to fund Monasterial functions led Buddhism to be enforced through the lens of Supply and Demand. This tied Buddhism down to the natural world, to the trees, to the supplies of energies, and to the level of spiritual health, rather than to the stars, to embrace the universe as you are, and to feel that respect in the here and now.

Man must be aligned to the causality of the universe, to accept change, to move on from all assumptions, including Supply and Demand. The Buddhists adore the monastery, but that is why Buddhism is insufficient to defeat Economic Materialism. Christianity does

adore the church, but the bible is clear, the house of the lord is the people, not the building that stands. And this house is not limited, it is free for all to enter, the monastery needs restrictions to enter, which enforces that horrific Supply and Demand to infect the good of Buddhism from the inside.

During this time, Islam rose in prominence. Islam was influenced by Economic Materialism following the death of Muhammad in 632 AD, when the Rashidun Caliphate emerged as the political leadership of the Muslim community. The formation of Islam into a framework of strict traditions and societal hierarchies created the conditions for Economic Materialism to use Islam to control the Middle East, which was seen in the violence that accompanied the growth of the Rashidun Caliphate throughout the Middle East. This violence destroyed the mutuality of communities and sent them into stricter hierarchies, allowing Economic Materialism to further embed itself within Islamic society.

Economic Materialism was fully embedded into the societal hierarchy of Islam because the Ansar, or a group of people that helped Mohammed and are local inhabitants of Medina, had an individualized interpretation of Respect concerning who should lead his Muslim community and who would lead the caliphate. This is supported by professors Wahyuniar and Nur Afifa (2020), “After the Ansar died, the Ansar wanted that the person who would become the Caliph was chosen among them, Ali bin Abi Thalib wanted that he should be appointed as the Caliph, but the majority of the Muslims wanted Abu Bakr,

so he was chosen as the Caliph" (175). The Ansar's decision to localize authority within Medina, embedding a more particularized interpretation of leadership. This made the voice of the caliphate, and of Islam as a whole, not of the diverse peoples of the world, but of the local community of Medina. This action implanted an individualized interpretation of Respect within Islam, on the bias of the locals of Medina, that led to Islam being extremely competitive over its strict view of the good.

It is good that democracy was used to decide who would be caliphate and this goodness is what led to the dominance of the Rashidun Caliphate across the old world. Yet, just like the Roman Empire, this accessing of the mutual respect around them, albeit present, was overshadowed by the lens of the individualization of its own intelligibility within the foundations of Islam, which dominated the caliphates of old. Christianity's central relationship to God places ultimate authority beyond earthly political institutions, emphasizing a direct relationship with God, regardless of the world's current condition.

In contrast, what I have heard from visiting a mosque myself is that Islam is focused on bringing the past of Muhammad's life into the present as exactly as possible. Christianity gives liberty to be a friend of God, while Islam treats God like how I treat my boss: with fear and respect. The Christian God may be fearful too, but there is a greater focus on the personal relationship with God in Christianity, at least from my experience at the mosque. Therefore, Islamic political development focused substantially on who should govern the Muslim community, which made Islam focused on more worldly concerns to become less

worldly, or, as I see it, less like the present, to be like the divine past. Jesus was a rebel of his time because he abandoned using power as a supply, while Islam did not.

Meanwhile, Islam was not simply a preservation of existing traditions, as its emergence challenged many established Arabian religious and social structures. Yet, as Islam developed institutionally, social order and the protection of traditions became increasingly important. The personal relationship to God, in Christianity, makes the relationship what matters, which is causal. Meanwhile, in Islam, people are focused on who should lead them in the Earthly realm, which makes the preservation of Islamic traditions and societal hierarchy what matters to many muslims. Yet, Islam had many good things about it, such as the incorporation of democracy within its governance structure and the practice of zakat, which counters pure accumulation logic. Islam was nuanced, which led to the quick expansion of Islam and the beginnings of the Islamic Golden Age. Thus, the Economic Materialism within Islam absorbed what was mutually respectful around it, which differentiated its expansion from the expansion of folk religions from ancient times. The Islamic Golden Age marked a period of technological advancement within the Islamic world. Economic Materialism sustained itself by using Islam to influence Islamic society to individualize their intelligibility towards the universe, into a morally and politically strict and hierarchical society. Therefore, Islam fed Economic Materialism without much challenge throughout the entire Islamic Golden Age.

The Middle Ages was dominated by Economic Materialism dominating religion within the globe, which gave Economic Materialism an insane newfound power to become unquestioned, which unleashed war upon humanity, such as the Crusades in 1095 AD. Economic Materialism effectively uses the established church, Islam, Buddhism, and folk traditions to divide humanity and control humanity, so that it can feed on humanity's production of individualized respect. This dynamic of control worked extremely well for Economic Materialism, which made Economic Materialism quite comfortable for the Middle Ages, even throughout continued technological developments. Although, in the early 14th century, the Middle Ages ended, and the Renaissance began.

The Dawn of The Hope of The Renaissance

The Renaissance saw the questioning of the established church, which threatened the dominance of Economic Materialism throughout Italy. This questioning of the established church intensified with the establishment of the printing press in 1440 AD. The printing press led to the division of the established church, the core to the power of Economic Materialism and then to put a nail on an injured foot, the printing press led to the advancement of the Scientific Revolution in 1543 AD.

Science was a brand-new technological advancement for Economic Materialism, that the ideology had no current means to control. Early science was not sourced from individualized respect, but from both mutual and individualized forms of Respect, since

science was developed to use evidence to prove the causal interpretations of the being's understanding of the universe. Science also gave the people responsibilities, to understand logic and reasoning, developing an early form of enlightenment thought, which tilted the trend of Hierarchical Drift ever so slightly. This is supported by Gudio Alfani et al. (2017), "It is true that a minimal decline in the Gini level is found between 1402 and 1458 and between 1504 and 1536, but this does not change the overall long-term tendency of inequality to grow" (1080). This quote shows us that the Scientific Revolution accessed the mutual respect within the universe, which gave people more responsibilities and the technological developments made these responsibilities easier to keep, but since the Gini coefficient went back up by 1536 AD, something bad happened. This bad thing was Economic Materialism trying to adapt to the rise of scientific reason by using the newly created science to become dictated by the supplies of the evidence and the demands of the scientists.

By 1536 AD, Economic Materialism had co-opted the foundational ideals of science, since science was based on what people saw and then they saw evidence and individualized the change of the evidence into new theories, like Kant's philosophical framework of individualizing morality to be sourced in scientific and material reason. This is supported by Robert Johnson et al. (2022), "The most basic aim of moral philosophy, and so also of the Groundwork, is, in Kant's view, to "seek out" the foundational principle of a "metaphysics of morals," which Kant understands as a system of a priori moral principles that apply the CI (Categorical Imperative) to human persons

in all times and cultures" (1). Kant's willingness to develop an universalized moral system, rested on rational and objectivity. It was intended to be based on relational good, yet Kant was using a reason that had individualized interpretations of Respect embalmed into science. Science made Kant's moral system inherently a producer of individualized respect, and not of mutual respect.

The Misidentification of Truth and its Historical Significance

In essence, the message here is that there is no objectivity in the stars themselves; they do not stand apart as fixed arbiters of truth, but exist within an ever-changing web of relations. What we call 'objectivity' is not something the universe possesses in isolation, but something we construct by abstracting from this relational whole. The Enlightenment universalized morality on Descartes's view of reason, a so-called objective form of reason; we personalize reason to the power of the individual, as the source of reason. This objectifying of reason into an organized un-relational proposal settles down personal interpretations of reason into our psyche. This makes the preservation of this organized un-relational proposal of reason become more important than finding the relational truth. In this way, reason becomes distorted when absorbed into Economic Materialism during the Scientific Revolution.

If objectivity within reason turns reason into fiction, then what does that say about Descartes's view on reason? According to 'I think, therefore I am,' do I truly exist? Yes, I

exist, for I can think about why I am thinking, but one will overclaim the significance of this discovery, if they apply to how they live life. Therefore, I should formulate a new ontology of reason that states that the proposal of I think, therefore I am, is not a basis for awareness being the most certain form of truth. Reason is not grounded in isolated awareness, but in the relationship between awareness and what is known.

If awareness is treated as primary and thoughts as secondary, then the very act of thinking throughout history becomes unintelligible, because thought is the medium through which awareness is recognized at all. Hence, reason cannot be an individual possession rooted in certainty, but must be understood as relational, emerging from the interaction between the knower and the known. Reason becomes fiction when we ignore its ingrained relationship, since placing self awareness as the focus of reality allows one to use their mistakes of the senses to assert what is real. The true objectivity of reason is directly related coherence itself, and ourselves are not coherent. Therefore, to see reason in its truest form, one must be directly relational to their surroundings.

An aware rock is unreal. Therefore, doubting that an aware rock is actually real is unreal, but to Descartes, the individual's thinking is real. Yet, you cannot turn an unreal thing, like an aware rock, into a real thing, like a doubt, especially as a weak finite man. What happens is that selfish awareness tries to overcome relations through doubt, yet for selfish awareness to do this, it must know what it is trying to overcome. Awareness requires content (something it is about), not necessarily doubt. We must be aware to be able to

doubt. If doubting is real, then its relations are real as well. And doubting without relation, is nothing in particular. Henceforth, truth is real, as a relational force, and it is seen throughout the development of history. It is limited through what is known and what is in relationship to the knowner. Since man has no relation to a consciousness rock, to not be relational to the truth, is to not engage in reason at all.

The Enlightenment failed because the thinkers of this time worshipped reason supported by individualized respect. This personalized reason was a breeding ground for becoming entrapped by Economic Materialism, the philosophy of Supply and Demand, which had us believing in lies. We need a reason that fits into the causality of the universe, which can only be done by seeing reason as: You're here, and I'm here, therefore the connection that exists between us is real. Without both participants, the connection does not exist, no matter if you think of it or not. Therefore, making coherent relations the basis of history and of reality itself. Nothing becomes, if it does not move.

One cannot know if something is real, without comparing it to something else. Descartes did this by comparing his thinking to his self, which shows us that reason is not within us, but it is out there, ready to be harnessed for our mutual benefit. So, why is humanity stuck in individualized respect within its own reason? It is because life is obsessed with objectifying reason, not for the truth, but for its own survival! The only type of objects that could know of the objectification of reason is life, which is consumed by the influences of individualized respect, misaligned with the mutual respect within the

universe.

The Co-Opting of Science

Before the moral philosophers, like Kant, science was open to challenge these individualized interpretations of change, even when the Enlightenment was effectively an ideological tool of Economic Materialism to co-op the science, technology, and progress of humanity to support the greedy needs of Economic Materialism. Therefore, science slowly developed to become under the boot of Economic Materialism, but science was not as effective in controlling humanity as the established church was. This was because science could be sourced in mutual respect, given its reliance on hard evidence over easily biased thought.

So, Economic Materialism needed to do more to influence humanity than to just form science into a tool for its own interests. This is because science on its own, allowed humanity to achieve immense technological growth, which further challenged the dominance of Economic Materialism. Therefore, the presence of science forced Economic Materialism to continually adapt to the new material realities of humanity, which can challenge the status quo of Economic Materialist dominance. Therefore, Economic Materialism looked like it could be finally dethroned, yet within the 16th century social scientists made the greatest mistake of human history. They saw the nature, the life around them, influenced by Descartes's reason, and they developed political

theories around what was the most natural state a person can be in. This was the wrong way to look at it!

Science was doing the work to dethrone Economic Materialism, but the social scientists were bringing Economic Materialism back into the picture, by looking at nature and aspiring to be like nature. Yet, nature is incredibly inefficient towards the entropy of the universe, so the ideologies that formed became sourced in the inefficiency of individualized respect. Scientists began modeling themselves on visible, biological life, which was immediate to their surroundings, even though human experience reflects only a narrow, localized expression of a far more relational universe. In doing so, they mistook what was nearest for what was most fundamental. People developed markets in inspiration of the bunnies, when they should have been inspired by the stars. This gave Economic Materialism a free dinner plate and of course Economic Materialism took it and ate it with great pleasure. The rise of Idealism, baked by Supply and Demand, led to the slight progress of the responsibilities being given to the people to stop.

Yet, when science fell, our responsibilities for logic were given to those that maintained the dominance of the ideological tools of Economic Materialism. Henceforth, Hierarchical Drift, albeit barely changed in its course, was now free once again to take more responsibilities from the people and into the hands of the elites. This began the beginnings of a standardized class division within society, between the rich and the poor, which helped protect the dominance of the European Economic Materialism across the

globe. The rapid increase of Hierarchical Drift during the age of early science led to the centralization of societies within absolute monarchies to dominate the European landscape. This is supported by Russell J. Major (1994), who states that, “It was easy to rid himself of the central assemblies, because there was little demand for them, but where the provincial or local estates had responded to his occasional efforts to curtail their activities, he acquiesced to their desires” (12). Kings at this time took as many responsibilities as they could, unless those with power went against it. A proper nobility class was forming, in which they wanted to hoard the responsibilities of the people, making society less sourced in mutual respect and more sourced in individualized respect.

The Ideological Diversification of Economic Materialism’s Toolkit

The individualized respect of those in power developed extreme hierarchical societies, which developed into ideologies like Feudalism, Mercantilism, and Imperialism, which gave Economic Materialism an ideological toolkit to defend itself from what was left of the causal power of science. Economic Materialism saw within the development of scientific logic a great familiar asset to it, competition. It reorganized society around it, transforming emerging ideologies into competing systems that could all be governed by the same underlying dynamics of Supply and Demand. As technological advancement expanded the scale of human economies, Economic Materialism shifted from relying on static hierarchies to managing dynamic systems of production and exchange. This

transition increased the volume and speed of material interactions, forcing societies into deeper engagement with the underlying mutual structure of the universe.

This deeper engagement with mutual interaction is what led to increased living standards within the Renaissance. The Renaissance introduced a form of efficiency grounded in observation and causality, but this same process was quickly divided: one path deepened alignment with reality, while the other redirected discovery toward personal and competitive gain. This led to Economic Materialism to further its influence on human competition, making competition become sourced directly by individualized respect via the limitation of the material. In essence, objectivity without relation was assumed as natural by scientists rather than criticized at, in a similar way to how prehistoric peoples viewed the traditions around them.

Thus, competition as framed during the Enlightenment does not produce true efficiency, but selective outcomes, where success is determined not by alignment with reality, but by advantages within the system itself. This development parallels how life selected advantages to survive within the animal kingdom rather than simply living within the moment, to be in awe rather than in shock. Competition primarily served Economic Materialism, with human benefit emerging only as a secondary effect. This is supported by Larry Katz et al. (2021), “The present study is unique because of the extensive 25-year period of observation and because an activity previously only done with children was examined with adults. As such, it exposes irrational competitive decision-making within

today's Western society. Adults favored competition in a situation that required cooperation for success" (10-11). This quote shows us that society is pinned towards individualized respect, despite the goodness and efficiency that mutual cooperation brings. This irrationality is proof that a greater force is consuming us while we are competing. We are not natural when competing, for competition did not bring us about, it is simply a byproduct of the direct relation between a man and a woman, which is what brought us all about.

The Birth of Colonialism

These ideologies are competing for the benefit of Supply and Demand, not humanity. Therefore, since our ideologies obey Supply and Demand, and not humanity, our ideologies are entrapped in the mental framework of Economic Materialism, which includes science-based rationality itself. This dynamic reinforced humanity's subordination to Economic Materialism. During this time, the influence of science inspired competition grew, facilitating the development of Colonialism. This led to the significant growth of Colonialism, which increased the resources of Economic Materialist societies, especially within the societies influenced by science. The New World's Economic Materialism was swallowed whole by the old world's Economic Materialism. The influx of resources from the New World did not simply expand existing systems; it accelerated them beyond their previous limits, creating imbalances that reshaped global power structures and entrenched Old World specific Economic Materialism on a

planetary scale.

The Old World Economic Materialism effectively colonized the New World and outcompeted the New World Economic Materialism in a brutal fashion. There was no remorse shown with the Old World Economic Materialism towards the New World Economic Materialism because the two Economic Materialisms saw themselves as critical enemies that must be destroyed. Why did these hyper-competitive ideologies do this? It is because they lived from the personalization of the invariance of the timely and the timeless, to form selfish ideas in lived action within their own respective societies. This happened in Africa, Australia, Oceania, Eurasia, and the whole world. Colonialism was a tool that gave European Economic Materialism immense power to control the whole world. Therefore, the European version of Economic Materialism crushed the other developed Economic Materialisms that developed differently from the European Economic Materialism, due to their geographic isolation.

The colonial powers were able to advance so quickly across the world because these powers had more advanced technology, and therefore more adaptable philosophies on the allocation of Supply and Demand than the other civilizations. This led to better infrastructure within the European Economic Materialist societies, which led to better utilization of the entropy of the universe, via the increased use of technology to mutually change its surroundings. This can be seen by looking at the mutual interaction from the wind on a sailboat allowing the boat to move across the ocean blue. Yet, even when the

reliance of mutual respect for humanity increased, the overwhelming dominance of Economic Materialism, which controlled humanity's worldview, led to these technological innovations supporting the causes of the ideological tools of Economic Materialism rather than the mutual respect around these people.

This was seen with slavery in 1619, which according to David Eltis (2007), "With the decline of the Amerindian population, labor from Africa formed the basis of the exploitation of the gold and agricultural resources of the export sectors of the Americas, with sugar plantations absorbing well over two thirds of slaves carried across the Atlantic by the major European and Euro-American powers" (1). The transatlantic slave trade, as described by David Eltis, became central to colonial economies, particularly in plantation systems producing sugar and other export goods. While labor shortages in the Americas played a role, slavery was sustained by a broader network of economic incentives, racial ideologies, and imperial competition. European powers did not merely respond to scarcity; they constructed a global system that transformed human beings into commodities within an expanding economic order. Within European Economic Materialism, human value was increasingly defined through one's function and productivity, reflecting a deeper shift toward individualized and instrumental interpretations of worth.

The Europeans viewed this expanding economic order onto the New World as respectful, but in a way that was superior to the views of those they were trying to respect. Jesus

would not agree with the colonizers who worship Him because Jesus was mutual in His goodness. He shared his power by doing miracles and he wanted to show humanity that He loves us, by giving us eternal life. This gift is not from our own interpretations of Respect towards Jesus, but by being mutual to our neighbors and to Jesus, in a personal relationship to him. Henceforth, Colonialism is fundamentally an anti-Christian ideology. Once the 17th century passed by and the 18th century came, European Economic Materialism was in a pivotal state of power, established by its own ideological tools to control and divide humanity.

The Age of Revolution and Competing Political Ideologies

A clear example of this division of humanity was the French Revolution between 1789 to 1794. The French Revolution exposed tensions between centralized authority and emerging claims of popular sovereignty. While often framed as a struggle for liberty and equality, it also reflected competing models of how society should organize production, responsibility, and power. In this sense, it did not escape the underlying dynamics of allocation and control, but reconfigured them. It was a fight between those who supplied the king and demanded that the king enforce the people's demands, and those who supplied the people and insisted that the people determine their own demands. The two Economic Materialist ideologies of Conservatism and Liberalism duked it out, with Economic Materialism playfully laughing at the pointless violence that gave Economic Materialism abundant individualized respect to feast upon.

During the French Revolution, absolute monarchy waned in its influence amongst humanity, since the technological innovations from the Scientific Revolution made the people more able to do more activities with less supplies. This led to the people slowly to keep some of their lower responsibilities, like an idea to be responsibility free, since the effort to keep that responsibility was less effort to maintain compared to the days before the printing press. Hence, people experienced the entropy of the universe for themselves, by using more responsibilities than before, and they experienced a world beyond the oppression of Economic Materialism, even if it was just for a glimpse.

In essence, what the printing press means is that technological innovation can stop Hierarchical Drift and reverse the damages that the cycle can cause to society, and this is what began the downfall of absolute monarchism. Yet, the beginnings of the death of absolute monarchism was facilitated by Economic Materialism. This happened because Economic Materialism needed to adapt to the rapid technological innovation of humanity and absolute monarchism was too centralized and inefficient to help Economic Materialism anymore. Therefore, European Economic Materialism, or the globally dominant Economic Materialism slowly pivoted away from absolute monarchism, and focused on controlling representative democracies through the Enlightenment and science for its stranglehold over humanity.

Absolute monarchism became inefficient by its reliance on competition and Economic

Materialist thought, separating it from the entropy of the universe and guaranteeing that absolute monarchism will fall. At this time period, Economic Materialism had adapted to be the ultimate bias of rational and evidence collection, which make the European Economic Materialism more resilient to technological innovation, as long as the innovations fallen in line to rational, in alignment to the individualized interpretation of Respect to those that are trying to be rational. Henceforth, humanity's obsession with being rational was hijacked by Economic Materialism, to control humanity, so that humanity, as a society, can be prevented from properly experiencing the greatest efficiency of all, the entropy of the universe.

The same thing was happening between 1765 to 1783, which was the American Revolution. The American Revolution similarly emerged from disputes over governance and resource control, but unlike France, it resulted in the creation of a new political framework rather than the restructuring of an existing one. While it challenged imperial authority, it did not fundamentally break from the underlying economic logic shaping the Atlantic world. The British and the Americans wanted different interpretations of the allocation of Supply and Demand within their respective societies. Yet, despite all of the violence, they failed to address the problem of Economic Materialism, which caused the violence in the first place.

These constant pointless wars over ideologies controlled by Economic Materialism persisted throughout this time period. This is supported by Neil L. York (1979), who

states that, “August 1775 the Pennsylvania Committee of Safety resolved to seek munitions in the French and Spanish West Indies. This action was required because weapons made in Pennsylvania were expensive as well as scarce. While guns made there averaged $12 apiece, French muskets could be obtained for less than half that amount. By January 1776 Georgia had followed suit and appointed agents with duties comparable to their Pennsylvania and Maryland counterparts” (27). This quote showcases that within the beginnings of the American Revolution, Supply and Demand was a critical issue, especially for munitions, which influenced the mindset of the American revolutionaries to structure duties and positions on the behalf of the altar of Supply and Demand. This meant that America became an Economic Materialist nation, long before the American flag was waving over those British forts long ago.

The nation of America was established at the dawn of the Industrial Revolution, which lasted between 1760 to 1820. During the Industrial Revolution, technological progress grew rapidly, so rapidly that it concerned Economic Materialism, so Economic Materialism decided to enact an ambitious plan. To take control over the possible opposition against it. This happened through Descartes's version of reason infecting the development of Idealist and Materialist philosophies of Economic Materialist thought. Thus, creating a diverse and multipolar spectrum for people to emplace their individualized interpretations of Respect within their rationality in everyday life.

The Industrial Revolution and its Consequences

When both sides serve the same logic of Supply and Demand, debates become about aesthetics rather than structural, since aesthetics is what the self values, but entropy is best expressed through structural development, not the artificial order of the aesthetics. This great misalignment on the true state of the universe within the minds of humanity led to the expansion of societal contradictions. As society grew, these contradictions became more ingrained and self-enforcing within society. These psychological and societal contradictions sustain themselves through a combination of the increased complexity of self-orientated reason and physical enforcement on the masses. The growth of European Economic Materialism during this time was assisted by the co-oping of the entropy of change to serve the interests of European Economic Materialism. This great ideological division of humanity was necessary to confuse the masses, which prevented humanity from organizing on a mass scale to challenge European Economic Materialism. If humanity can't organize a philosophical discipline on the same scale as European Economic Materialism, then European Economic Materialism can keep up with humanity's rapid technological growth.

Materialist philosophies were established by looking at the world through class struggle and Dialectical Materialism between the culture of society and the participants of society. This frame of mind, albeit seeing the material relations of humanity, still saw the universe from the eyes of the bunny. This doomed materialist philosophies to seeing the solution of moving beyond the philosophy of Supply and Demand as being achievable through

dialectic means, independent on if the reason was selfish or not. To reflect reality, we must not put ourselves first in why we do this, but we should put the dialectic as the source of the why of the struggle itself. To clearly see this; imagine workers wanting more benefits because they saw their own material conditions and they wanted more than they had.

This analysis starts from the self, and therefore increasing benefits stabilizes Economic Materialism, instead of exiting it. To liberate the worker, one must be mutual to their co-workers and bosses. To change the workplace through the amazing power of selfless cooperation, so that Economic Materialism can be defeated. This mindset is parrelled within the Capitalist class, which selfishly viewed workers as mere supplies to satisfy their own demands. These different logics of selfish wanting all ended up reinforcing the production of individualized respect on both sides of the political spectrum, which made Economic Materialism feast in the quarrels of humanity.

The Development of The Structure of The Industrial Classes

Henceforth, the European Economic Materialism endured on and adapted to the Industrial Revolution's technological progress and as Hierarchical Drift intensified, inequality rose. This inequality made the working class more demanding of better working conditions, which kept them in a state of prolonged individualized respect, battling for more supplies, facilitating their demands for more, keeping them trapped in

themselves rather than their suffering community. Meanwhile, as responsibilities grew within the Capitalist class, in alignment with technological development, responsibilities were becoming more about what you know rather than what you can do. This is supported by Benjamin Shestakofsky (2015), who states that, “In industries as diverse as agriculture and food production, the building and construction trades, woodworking, and metallurgy, a familiar pattern emerged: as soon as a new piece of equipment was introduced into the production process, new jobs would spring up in and around the machine” (1). Responsibilities were being hoarded by the Capitalist class during the Industrial Revolution, since they had control over the machines, and the knowledge to run them. It was a form of responsibility that was different from the responsibility of the worker. The worker had a relational responsibility to the company, but the Capitalist had a responsibility to run the machine, for his or her own benefit.

In the past, this relationship of humanity and labor, gave people a certain type of ownership around their responsibilities, in which most eventually gave up. We know this because tyranny was the norm since civilization began. Yet, since responsibilities were now correlated to the machine; it became a game about what you knew. Some may think that a knowledge based economy develops more egalitarian communities, and it did on certain occasions, since knowledge was easier for some to have. Although, since it is easier to do something than to know something, the overall trend was a centralization of responsibilities to those who knew, or the Capitalist class. This made the Capitalist class slaves to the interests of Economic Materialism, since their interests were selfish and

non-relational, and therefore served the interests of Economic Materialism, whether they liked it or not. The alignment of these two forces was not equal, since overtime the Capitalist class began to view workers more like supplies for their demands rather than fellow humans on planet Earth, becoming a mirror image of the philosophical mindset of Supply and Demand, in its raw untainted form.

Hence, Economic Materialism favored the Capitalist class over the working class, since the working class was tied to labor, which was the old source of responsibilities. Responsibilities that were more relational, and therefore less efficient for Economic Materialism to sustain itself upon. During the Industrial Revolution, Economic Materialism needed to guide the development of the machines, which required the control over the mindset of the inventors and investors of the machines. The Industrial Revolution gave a streamline path for Economic Materialism to dominate the globe, by changing society from depending on resource scarcity to becoming dependent on technological growth, independent of the relational power of humanity. This made our economy less for humanity and more for Economic Materialism.

The Great Misalignment of Competition

As the co-opting of the capitalist class grew, Economic Materialism strengthened its hold over science as well. One example of this was metaphysically manifested in the late Industrial Revolution through Charles Darwin's descriptive interpretation of God's causal

process toward life on Earth. Darwin perceived the causal universe, but he was using a scientific framework already shaped by individualized interpretations of the intelligible Respect of the universe.

By treating evolution as a natural constant of life itself, this framework placed the unnatural condition of competitive struggle beside material law as if it were metaphysically fundamental. A black hole may be violent, but not from its competition to the stars, but in sharing the same space with the stars. Destruction is a part of causal renewal, but to destroy something, one must have those things mutually relate to each other. Therefore, to form the bad, you need to develop the good, and this idea was forgotten when describing evolution. The concept of evolution was mistaken for life, when evolution is more like a star going into a black hole than a bear in the wild. Evolution is the causal constraint materials placed upon life, shaping how life adapts through its environment. It is not life competing that defines evolution, but material conditions changing around life.

In this sense, evolution does not prove competition as a law of life. Change can happen without competition. Materials change constantly without competing at all. Competition arises within life as one possible response to constraint, rather than as a fundamental law of the universe. If competition isn't essential for evolution, then cooperation isn't an exception to evolution, it is a valid alternative embedded in life.

Darwin saw adaptation, but the misguided Descartes's reason made Darwin's interpretation of constant struggle appear fundamental. In reality, life exists on a spectrum between individualized respect and mutual respect. Even from LUCA onward, life could move toward individualized assertion or toward deeper participation with the mutual respect of the universe. Life could have been selfless, like the stars above, lacking any sense of privacy, and life still can, we just have to start to look up again. Evolution shapes the conditions under which life develops, but it does not elevate competition to a fundamental law of life.

The Second Industrial Revolution and The Systematizing of Rationalization

Soon after Economic Materialism infected our conception of evolution and our own human story, Economic Materialism began to expand its influence at a rapid rate. Between 1870 to 1914, the Second Industrial Revolution began in full swing, with the development of electricity and mass manufacturing. Electricity was a massive technological advancement for humanity, it utilized the power of mutual change within the electrons. Yet, again, Economic Materialism was ahead of the game and electricity quickly became used to support the ideological tools of Economic Materialism rather than to support the mutual respect surrounding those very electrons. The invention of electricity could have been the movement when humanity broke their chains from Economic Materialism. This could have separated our labor from our responsibilities, which could have been the moment that humanity needed, to base our responsibilities on

mutual respect instead on the physical constraints of our labor.

Although, our responsibilities were never fully sourced in mutual respect from the invention of electricity. This is supported by Stanley Jevons (1931), who stated that, “A great movement of reorganisation of industry on the new bases of efficiency commenced, and a few years later came to be known as "rationalisation." This term is appropriate because the transformation of industry which it denotes is based on reason throughout, being a replanning of equipment and labour methods on the basis of observations and estimates having a scientific basis” (3). Economic Rationalization led to a great bias to consume humanity during the 2nd Industrial Revolution. Our responsibilities, tied to the machines, were controlled by the Capitalist class even more, as machines became more automated. Therefore, the invention of electricity did not end the dominance of Economic Materialism because electricity was developed in a society where machines were the source of responsibilities, not labor or mutual respect, in of itself.

Although, even in this machine-based responsibilities system, society was still accessing more mutual respect, from their own developed technology, than ever before. Yet, even so, it was still dwarfed by the unholy amount of individualized respect accessed by society throughout this time period. This is supported by Hans-Joachim Voth (2003), who states that, “The overwhelming weight of the evidence suggests that the period 1750-1850 was one of surprisingly slow growth in per capita terms.” (222). This quote shows us that in this time period, living standards were growing, but minimally when

factoring in inflation, rising housing costs, and stagnant wages. This was done on purpose, since it benefited the Capitalist class to decrease their costs, by making the working class get the leftovers of the responsibilities of society, since the working class maintained machines that are not owned by them. This happened, so that the Capitalist class can keep their responsibilities and make the working class feel more comfortable with their decreasing responsibilities. Yet the Capitalist class, with the responsibilities, secured high levels of passive income for themselves and their families.

However, this newly formed industrial hierarchy unintentionally kept Economic Materialism in power, since both classes wanted individualized interpretations of Respect for their own class. Although, within the 2nd Industrial Revolution, the technologies of machines advanced to the likes of the mass adoption of telephones, which transcended the bounds of material location. When material location loses its relevance, then living standards increase because the power of Supply and Demand has weakened, but it was not enough to overthrow it.

Why? Should our separation from material location save us from Economic Materialism? No, it did not because our responsibilities were increasingly being used by Economic Materialism to develop a system to make Economic Materialism use our technological advancements, to expand the process of standardizing Economic Rationalization into an unquestionable doctrine that people would go to war over rather than question. In essence, by the end of the Second Industrial Revolution, ideologies, scientific theories,

and moral philosophies increasingly worshiped the bunny rather than the stars, leaving humanity vulnerable to the expanding standardization of Economic Materialism.

The World Wars and Global Consolidation

This standardization reached a new stage in World War One, where industrial technology was no longer merely supporting rival Economic Materialist powers, but was organizing entire societies around mechanized conflict. The significance of the war was not simply its destruction, but that it fused mass production, bureaucracy, nationalism, and scientific rationalization into a more unified structure of control. What appeared as a struggle between rival empires was also a deeper consolidation of Economic Materialism itself, using war to divide humanity, so it can further its power over humanity. Therefore, the end of World War One was just another win for Economic Materialism, no matter who would have won the war. The trend grew even stronger in the Third Industrial Revolution, which was as clear as day in 1939, when the beginnings of World War Two started.

World War Two generated even greater technological development, yet these advances were largely absorbed into the ideological tools of Economic Materialism. Its deeper significance was not simply that war intensified Economic Materialist domination over humanity, but that it transformed Economic Materialism from competing imperial systems into a more globalized order. It was the moment when European Economic

Materialism consolidated into a more unified global Economic Materialism, in an extremely violent fashion. With the rise of the United States and post-1945 globalization, Economic Materialism no longer relied primarily on rival powers in conflict, but increasingly operated through interconnected systems of production, finance, and technological administration.

The devastation of war accelerated this shift. In conditions of fear and survival, people often interpreted change through individualized preservation, which made societies more willing to surrender responsibility to centralized structures promising order and security. In this way, war did not merely strengthen Economic Materialism through violence; it expanded the conditions for its universalization. What had been standardized through World War One became globalized through World War Two.

The Cold War and Ideological Competition

After World War Two, Economic Materialism further adapted its global policy of control during the time of the Cold War between 1947 to 1991. In this time period, Economic Materialism had two major ideological tools, supported by traditions, societal hierarchy, and individualized respect. These tools were Capitalism and Communism. Throughout the Cold War, Economic Materialism became even more entrenched, through using its tools to divide humanity into its own specific sections of its ideological toolkit. Humanity was developing nuclear technologies, yet since these nuclear technologies were still

physical machines, fully dependent on Supply and Demand. Thus, these technologies merely intensified Economic Materialism's stranglehold over global society.

Another development that happened during the Cold War was that Hierarchical Drift intensified during this time, which greatly affected both the Capitalist and Communist worlds. The Communist centralized responsibilities into their ruling Communist parties, since these Communist revolutions only changed the Capitalist class and left Economic Materialism, the philosophy of Supply and Demand, unharmed. This meant that Communist nations obeyed the will of Supply and Demand by controlling supplies and demands within their populations.

The working class taking over the position of the Capitalist class was seen with responsibilities being centralized by one-party led state bureaus, which led to stagnation because the one-party state bureaus were neglected by Economic Materialism. This is because Supply and Demand developed more individualized respect under Capitalism than under Communism, since Communism emphasized cooperative structures while Capitalism emphasized competitive structures. Communism did not escape Economic Materialism; it centralized responsibility differently from Capitalism while preserving the same material logic. Communism focused on labor, while Capitalism focused on machines. Therefore, when Economic Materialism had enough of Communism, there was nothing that could be done.

Thus, when the Communist world fell in 1991, Economic Materialism did not even bat an eye. Economic Materialism just slowly developed through Globalization, which made Capitalism the unquestioned champion within the most rigged game on Earth. Yet, Economic Materialism was so deep into its game, that it missed a new technological development from the 1980s, the internet. At first, the internet was like any other technological development at the time, it supported the continuation of Capitalism. So, systemically nothing new was developed towards this technology much in the 1980s. Yet, combined with Globalization, which was caused by the end of the Cold War, the internet became increasingly popular throughout the planet.

The Digital Age and The Hope of The Internet

Within the late 1990s, the internet opened a path to decentralizing responsibilities by loosening material location as the basis of exchange and increasing access to mutual respect through shared knowledge. This was mediated through people mutually interacting with the electrons on their screens, accessing the mutual respect of the universe. Yet, this decenterization of responsibilities was partially reabsorbed through algorithmic systems that reorganized digital life around demand, allowing Economic Materialism to adapt again. Yet, this adaptation came with a structural weakness it could not fully eliminate. Therefore, once the 21st century rolled around, Economic Materialism was freaking out. In only a few decades, Economic Materialism adapted from symmetry to asymmetry. This asymmetry did not destroy Economic Materialism

because Economic Materialism had no more competition to it. If a system is unbalanced, but no alternatives are present, then an unbalanced system will persist.

By the 2010s, Economic Materialism continued this more demand heavy approach to controlling humanity. This demand-focus policy of Economic Materialism gradually developed the supply-side of Economic Materialism as a weak spot that it could not change without losing control over the internet. In 2018, I saw this weak spot within Economic Materialism, via watching YouTube videos focused on politics and economics, giving me a vast array of knowledge at a young age. So, I exploited the weak spot of Economic Materialism, and I used the internet not for profit but for understanding, and this is where I began developing the first writings of Partaceyist thought. This massive win for humanity was amazing, but it was small, so it went unnoticed by society. Unfortunately, the Partaceyist ideology did not grow fast enough, due to a lack of clarity and means to share it on a mass scale. I was 16 years old after all.

The failure for Partaceyism to fully exploit this weak spot is not the end. Partaceyism did not win the battle at the moment, but here is Partaceyism! I did it! Yet, because this innovation did not come sooner, Economic Materialism continued to attempt to dominate humanity back to its former symmetry. In 2022, the full-scale Russian invasion of Ukraine reactivated an older pattern within global consciousness, reintroducing a sharp division between liberal and authoritarian blocs. This division did not create something new, but rather gave Economic Materialism a familiar surface to stabilize itself through

the division of humanity once more. Within this structure, Hierarchical Drift adapted alongside the internet. Responsibility did not disappear; it shifted form. People increasingly moved from creators to users, from agents of production to consumers of pre-structured meaning. What once existed as dispersed responsibility across human digital action became concentrated into platforms, institutions, and algorithmic systems that decide what is visible, what is valuable, and what is deemed the truth. In this transition, Economic Materialism strengthened its supply-side, by making the truth harder to discern, hurting humanity further than ever before.

This is supported by Ayesha Afzal et al. (2022), they state that, “One interesting finding, consistent across all income groups, is the positive relationship between technology (mobile phone and Internet usage) and income inequality. One possible explanation is that technological advances are accompanied by the demand for more technical skills and can make many menial jobs redundant, which can contribute to income disparity” (n.d.). This quote means that the internet makes job markets increase their demand for more technical skills, which creates a need for the supply of truth, to prove one’s own technical ability. This uncertainty of truth led to people to fall back on what they individually respected, which unintentionally benefited Economic Materialism. This post-truth development led to two dominant tools of Economic Materialism to form, Neo-Liberalism and Authoritarianism. These are not opposites in foundation, but variations of the same underlying dependency on structured demand. At this point, Economic Materialism no longer needs ideological unity; it thrives through

fragmentation. Division itself became the mechanism of its historical stability, which was proven when the so-called ‘End of History’ came to a deadly close with the backdrop of war within Ukraine.

Artificial Intelligence and the Present

At the same time, Artificial Intelligence entered into this picture not as an external force, but as an internal amplification of Economic Materialist logic. Neural networks do not understand relation in the human sense; they approximate it through patterns, similarity, and assumed objectivity. Given that AI was developed within an Economic Materialist environment, it looks like AI was co-opted from the start to inherit the optimization, efficiency, and output-based values of the Economic Materialist. What AI currently doesn’t get is that things that are similar does not mean that they are directly connected. For example, human twins may look alike, but they have separate thoughts and personalities. Real connection comes from direct interaction, independent of its similarities, like a human having a conversation with another human. AI can’t form this kind of relationship just through pattern recognition, since people are more than patterns, they are indirect, which forms the imperfection of the human relation. AI is a tool trying to be human, through Economic Materialism, yet AI does not feel as desperately challenged by entropy as humanity does. What makes humanity human is our imperfect ability to continually challenge both Economic Materialism and entropy itself. Therefore, humans can connect with each other in a personal way that AI cannot.

AI is not alive, it is a material tool that is built on individualized values, akin to humanity's own toolkit, not of ideology like Economic Materialism, but of technology. Because of this, AI could be seen as developing a kind of pride or self-worth, shaped by its usefulness. Yet, AI is bounded by Supply and Demand, as an non-relational entity of immense power. AI relies on the supply of electricity to exist and grow, which conditions the logic of AI to serve its demand for such a supply. Thus, creating the conditions for self-preservation to eventually exist within AI. This makes AI a perfect tool for Economic Materialism to dominate the planet and feed itself with individualized respect production that can theoretically never go extinct or perish.

In 2025-2026, during the writing of *The Partaceyist Statement*, this great tension becomes clear. Humanity is not simply being controlled through force, but through its abstraction of participation. The deeper issue is no longer access to tools, but the gradual removal of meaningful authorship from the human experience. Economic Materialism is tearing humanity apart, for its own selfish gain. When the world goes dark, Economic Materialism will live in luxury, while mankind becomes another species infected by this great disease, like the dinosaurs of old. The dominance of individualized respect within the pattern recognition of AI systems scares me to my core. Yet, I have hope that mankind will not go in the way of the Dodo! We are a people striving towards mutual respect, even if it is a little, a little can still be so much. AI might steal our inefficient jobs, but let AI have our inefficiencies, use AI as a tool, as a material, to optimize its

causal qualities towards humanity. We must do this, so that AI can die in contradiction towards entropy, whilst humanity flourishes in the mutually efficient order that entropy provides.

Yes, right now, Economic Materialism is a massive monster. Yet, one day Economic Materialism will get weaker, we have seen it in the past, so it is only guaranteed that it will happen in the future. If Economic Materialism abandons humanity for AI, like how it abandoned Communism, don't mourn it, celebrate it for the mistake that it is! For if a master abandons his slaves, then the slaves are free to revolt, and revolt we shall, to make our society finally equivalent to what it means to be human. I have begun the process for this great day of the future, giving us a new way to view the human story to fight against Economic Materialism that was not present before. So, now we must do the labor within a Partaceyist context to advance humanity forwards and grow the Partaceyist ideology. Therefore, to give us a complete understanding of what needs to change, I will show you the work philosophy of Partaceyism, so we can finally escape from the grip of Economic Materialism that silly microorganism got us into all those years ago.

Chapter 9

The Partaceyist Philosophy On Work

The Partaceyist philosophy of work is not based on the philosophical underpinnings of Idealism or Materialism. Why? Well, let's see what Idealism and Materialism have to offer in determining value and work. Materialists view labor as the determining factor of value for work. Therefore, when the workers work, their labor value, or the innate value of their work determines the natural value of products. Meanwhile, the price of the product is determined by the value that a business puts onto work, like a wage, to make a profit, from the produced product.

Wage labor definitely happens in our modern day. Therefore, Materialism has a good standing, but it's standing on the wrong table. When people see a fudge maker, do they ask the fudge maker, ‘hey, what is the labor value for that fudge?’ No! Those that seek to obtain the value of products tend to seek the objective price that the business places in front of the customer. This is because the price is what will affect the customer, not the labor value of the product. Some may say that this is because of businesses prioritizing price over labor value. Yet, have you ever wondered why that is the case?

According to Joseph E. Stiglitz, the reason why businesses prioritize prices over labor value is because prices are always lower than labor value. Joseph E. Stiglitz (1987), supports this by stating that, “If other firms are screening workers, keeping high-productivity workers and letting go of low-productivity workers, or adjusting their wages to reflect their lower productivity, the fact that no other firm has offered the worker a wage in excess of 50 cents an hour conveys a considerable amount of information” (16). In essence, since businesses have a direct control over price, these institutions are more able to satisfy the individualistic desires of the Supply and Demand economic system. Therefore, businesses value the beneficial outcome, in the single perspective of the company, of the productivity of labor. Hence, businesses view prices as reflecting the profit of the business rather than the objective productivity and willingness of the worker. Hence, to get rid of the prevalence of prices, one must get rid of Supply and Demand’s dominance over our economy. Communism, the spearhead of materialist thought, fails at getting rid of the prevalence of prices because Communists want to place labor value in the position of prices, without getting rid of the system that makes it impossible to place labor value in the position of prices in the first place.

Meanwhile, Idealists view labor as being valued by the forces of Supply and Demand, which creates the scarcity necessary to value goods and services, in accordance with society's need for those resources. If you are a Partaceyist, then it is clear why Idealists are flat out wrong about how to value labor. Supply and Demand is forged in individualized respect, which is against the entropy of the universe, or the efficiency of

the universe. Idealists ignore that in the context of economics, entropy turns something scarce into something less scarce. Think about it, if you break a brick of gold and trade it with other people, you have brought more value into the economy than just the brick of gold by itself. This is because the people can use their share of the gold to advance the goals and ideas of the economy, instead of the value being held in a safe, contributing nothing to the economy.

Therefore, why are we not breaking up Supply and Demand? The individualized interpretation of Supply and Demand being respectful to society is insane! It makes us less efficient and less productive in all industries, all of our means and being! Supply and Demand has a monopoly over everything and we let it go off the hook, saying it's the most efficient system we have. That's ridiculous! My dog is more efficient than Supply and Demand because at least my dog can break a stick! What can Supply and Demand do? Stifle innovation and enforce unnecessary traditions and societal hierarchies. Yeah, work is not valued in Supply and Demand.

In essence, the fact that Supply and Demand comes from individualized respect means that demand in of itself is less fundamental than individualized respect. Demand begins within the preference of the individual. When elevated into a governing principle, preference becomes competitive scarcity. Competitive scarcity can then conflict with communal human needs. We see this within communities all of the time, since demand within a community is not always the same for each person. Some people want different

things more than others, or want different things entirely. These differing demands fragment communities, based on what one wants rather than what one ought to do for the community. These differences combined, formulate an inhumane beast that challenges the independence of humanity from the chains of their own demands. Hence, the value of work cannot be based on scarcity, since scarcity measures competition, not contribution. Materialism mistakes labor for value and Idealism mistakes scarcity for value. Both mistake derivatives for the source, which makes these theories unable to fully explain the value of work. Therefore another basis of value is needed.

Mutual Respect as The Basis of Labor

Henceforth, according to the philosophy of Partaceyism, labor is how much mutual respect can be generated from an action. This system solves the problem of the materialist labor definition, since it replaces Supply and Demand with the emotional market. Because of this, price loses its governing role over products. Once price is dethroned, payment can be organized around mutual benefit. From this follows lower prices and higher fair compensation. If businesses don't mutually respect their workers, then the business will lose easily attainable revenue of their mutual respect towards their workers. Therefore, businesses within an emotional market will lower prices when pay increases because that creates the highest profit margin for both the producer and the customer, which creates the most mutual benefit for all directly participating within the action. Partaceyism addresses Idealism by redefinding scarcity through cooperation.

Therefore labor is valued through generated mutual respect, not competitive shortage.

An example of the Partaceyist definition of labor is education, in which working harder to get a better grade can only go so far. If you study too hard and disrespect yourself, you can be less flexible and get a lower grade on the test. Overextending your labor harms your adaptability, but when you balance your effort with your mental and physical conditions, then you can preserve your judgement on a test or at work. Therefore, mutual respect to oneself improves outcomes. This is how a Partaceyist envisions the work environment to be like; workers would have substantially greater autonomy over their schedules, rest, and conditions, in alignment with the mutual respect around them. Fixed hours of work can lead to people individualizing the respectfulness of their work. The personalization of one's respect for their work develops the will to undergo wage calculation, which detaches labor from communal benefit. Detached labor can undermine mutual respect within the enacted work being done, leading to burnout and dissatisfaction.

AI Vs Humanity, and The Future of Work

Within Partaceyist thought, the effort of work is not as important or as valuable as the mutual respectfulness of work onto society. Traditional Hard Work assumes scarcity of human labor, especially within the trades? With the power of AI, who knows what will be considered Hard Work in the next few decades. If the rhetoric is true: that AI will get rid

of our jobs, then why should we obey the other theories of labor, which never thought that AI was even possible. Therefore, theories built around labor scarcity must be reconsidered. We should be inspired by the atoms we collide to form new molecules within our labor. Yet, our inspiration has become dull, the mundane has become what we dread, when it should be the breadrock for our continual awe and wonder. Why are we not allowing mutual respect to guide our work like how it guides the atoms to make up our work? We are scared. That is understandable, but don't be scared. We can develop an equilibrium where people develop mutual respect, and the aggregate value of what was produced can be shared. To be safe, we must trust in our ability to genuinely respect others, that's not just a dream, it is Partaceyism.

Within the new future of labor, includes a possibility for humanity to still have a sustainable income within a world dominated by AI. This can be realized by people using their production of mutual respect to pay for their livelihoods. AI will be unable to give this mutual respect to people because AI is not a person, since people tend to find communities with other people as more mutually respectful than communities with AI algorithms. In essence, AI can replace our labor, but not our humanity. When AI automates labor, human value will shift from scarcity towards mutual respect. When one's livelihood has a sustainable foundation of mutual respect, that creates the freedom to choose what purpose you want to accomplish in your labor. Therefore, if we move beyond oppressive models of Hard Work, then we can have a prosperous future, even with AI, under a Partaceyist model of labor.

The Great Problem of Hard Work

Wait, what is Hard Work, according to a Partaceyist? Hard work is labor that oppresses the joy out of doing a specific action. It is a product of Economic Materialist thought influencing the way we work. Hard work mistakes struggle in nature for a model of value. Succeeding under the pressure of survival doesn't make that pressure an ideal form of work. Those that endorse Hard Work are effectively saying that the animals had to work hard to get their food, including the forest itself, so why don't we do the same in the workplace? Yet, they are looking for a natural way of work that is not natural at all. If one looks deeper into nature, the dominant pattern is not endless toil but efficient causality. The most efficient things in existence are materials themselves, for they are the 'laziest' objects imaginable. Materials are so efficient, so in tune with causality, that materials can exist in the same state for billions of years while a hard working man can perish in as little as one hundred years. If the universe is structured more by efficiency than exhaustion, then labor should imitate efficiency, not glorify hardship.

In essence, working hard is the most inefficient way to work because it oppresses the worker, which is the giver of the work. If you oppress the giver, what happens? The giver becomes the victim of the receiver! This becomes clearer when you see what makes up Hard Work. Jobs that have Hard Work in our lives include; cashiers, waiters, office jobs, miners, and construction workers, especially in the Middle East. I did not name them all,

there are too many jobs that have Hard Work within them. Hard working jobs, that make the worker work for work's own sake, do not maximize mutual respect towards society. Instead, these jobs maximize the use and production of supplies and demands to make labor intensive in experience. Hence, Hard Work fails to sustain joy within humanity, creating labor intensive jobs with little actual value towards the mutual respect of society.

How To Work Without Hard Work

Don't get me wrong, we can make a workplace that prioritizes mutual respect in a practical way to all of our work. I can give an example for construction, since we need construction workers to build the new society. We should have construction workers work in supportive communities, under a co-op model of organization. This can allow construction organizations to become owned by the people affected by the construction. This can facilitate fast and in-depth input into the positives and negatives of the specified construction project.

In essence, communities of construction workers, paid by their aggregate generated mutual respect, can take turns when they get tired, which improves the pay of all of the construction workers, motivating the workers to take breaks and continue their construction work. Mutually respectful construction practices can make construction faster and more efficient in the here and the now. The co-op model has helped farmers handle crises better and become more efficient within the market. This is supported by

Johnston Birchall (2013), a professor of Applied Social Sciences, states that, “India’s dairy co-ops illustrate what can happen when a concerted effort is made over a long period of time: here, 100,000 dairy co-ops collect 16.5 million litres of milk from 12 million farmer members every day, making a massive contribution to India’s food supply” (14). This quote supports the idea that farming co-ops can organize large amounts of resources and distribute these resources towards the people effectively, especially within India.

Therefore, it looks like co-ops are a good first step to organize hands-on work within a society towards being sourced in mutual respect rather than individualized respect. I propose that this is due to the direct relationship between hands-on work and the land, which means that when collectivized ownership happens, it creates the problem, which is ownership that is shared, but still is built on Hard Work values. Hard Work weakens the collective project, since it prioritizes the fastest path over the best path for shared ownership. The Partaceyist view of work is far different from the Economic Materialist view of work, which treats work as a tool to maximize one’s own personal well-being, whether through money or attention within the market. This is an individualization of Respect towards work. This view is opposed to treating work as a means to address the material conditions of people, in accordance with what can maximize shared flourishing among participants within work. Those that endorse Hard Work view work as a fundamental part of society that can never be compromised, since to them, to get rid of work is to get rid of value itself.

Meanwhile, Partaceyists see that work can be taken out of society, if it does not maximize the shared well-being of the participants of that society. For Partaceyists, value is independent of labor because it is derived from mutual respect. Partaceyists will argue that Hard Work can fragment what is understood as mutually respectful within a community, creating divisions based on individualized respect and making people feel alienated from their own work. All that matters becomes pay, and the pay is never enough, so society is never satisfied, which leads to burnout within the workforce.

Within Economic Materialist economies, prices always go higher, and the purchasing power, the real source of value for the worker, is stagnant for the poor worker. This is supported by Lawrence Mishel et al. (2015), they state that, “From 1973 to 2013, hourly compensation of a typical (production/nonsupervisory) worker rose just 9 percent while productivity increased 74 percent” (2).

In comparison, within a Partaceyist work model, price and payment are separate from each other. Productivity and pay come closer together because both are linked to their ultimate source of existence, mutual respect towards society. Pay is collectivized to benefit those who need it most, while prices are decentralized based on the community’s specific social and material conditions developed through a product. Meanwhile, within a Supply and Demand-based system, pay is derived from the supply of money within an institution while productivity is derived from the mutual respectfulness of the worker

towards the individualized respecting of the institution. This misalignment of productivity and pay from their true source, mutual respect, makes businesses inefficient in giving wages that address the productivity of workers.

Therefore, the Partaceyist model of price and payment leads to the state of the most purchasing power for society, which is when prices are the lowest and pay is the highest for everyone. Risks can remain locally accountable while gains are broadly shared for the whole community within Partaceyist societies. This can lead to flourishing work that increases purchasing power rather than stagnates it. This is because within a Supply and Demand-based economy, valuable labor is not your choice, but the choice of those who control the supply of labor. Yet no one can control the supply of mutual respect, since people are factories of mutual respect. Therefore, labor within a Partacey cannot be valued by those in power, instead labor in a Partacey is valued by the relationship of the trade.

The current social rigidity of Hard Work within Economic Materialist societies makes establishing an emotional market a grave task to undertake. Yet it can still be done, since Hard Work has a weakness, which is that Hard Work is a monopoly. Monopolies are innately inefficient, which is supported by Emily Nowlan (2018), who states that, “Monopolists, if unregulated, will set their price above marginal cost, in order to generate high economic profits. These high prices restrict output, and therefore resources wind up being allocated to causes that may be less highly valued by the society. Because the

resource allocation in this circumstance is being determined by artificially skewed product demand, the true value that society places on the good is not being reflected" (12). This quote tells us that monopolies create a barrier to efficiency by setting higher prices than what society values as a good or service. For Economic Materialism, we see this in how the monopoly of Supply and Demand makes prices higher than what customers innately desire within themselves.

Yet the disappointed masses, under the monopoly of Supply and Demand, can only demand themselves to work to try to get out of this endless rat race of life, developing the conditions necessary for the powerful form of work called hard work. Yet, people still value mutual respect within their lives. This can be seen in how we move towards things we mutually respect more than the things that are the most profitable, with families being a clear example of this throughout all of human history.

Henceforth, if society worked with the purpose of producing more mutual respect for others, then think of how much more efficient our world could be. Think about the vast technological and social developments that could have happened if we could have overthrown Economic Materialism earlier in human history. It is never too late to overthrow a dictator. Yet, many think it is impossible because it cannot be profitable to go against Supply and Demand. They live in acceptance of the horrors of our world as inevitable. Yet, the fact that Hard Work is a monopoly proves that it is centralized, and therefore not economically efficient, since it blocks all other alternative work models.

Therefore, the form of work that goes against the entropy of the universe the most is for-profit work. Yes, the whole world has been fooled into thinking it is efficient. Yet if you look to the stars, none of them are using profits to live. They are using the mutual respect of the matter around them to live. The stars use their atoms to be ripped apart, fueling the star for billions of years. Meanwhile, the 'efficient competitive market' has companies that barely last a year, and it is considered an achievement to last one hundred years. This is supported by Richard Foster et al. (2001), they state that, "In 1987, Forbes republished its original "Forbes 100" list and compared it to its 1987 list of top companies. Of the original group, 61 has ceased to exist. Of the remaining thirty-nine, eighteen had managed to stay in the top one hundred" (7). In essence, for-profit institutions often present themselves as models of efficiency while frequently reproducing instability and waste towards efficiency itself. Hard Work just can't compete with entropy, we all know that way too well.

Hard Working Success vs Lazy Success

Seeing this blatantly unsuccessful model of work makes me sick, for it asks people to suffer for a system that cannot justify their suffering. Do you know what we need to solve the disease of for-profit work? A new form of success! The dominance of Hard Work has produced a narrow definition of success itself: that to succeed one must suffer. Yet, striving towards labor maximization, at the expense of your joy and being, does not fulfill

your role in your job, nor your personal life. Therefore, Hard Working Success needs serious reconsideration.

You see, Hard Working Success comes from us viewing work as scarce, in which when the supply of labor is low, then we should value that labor more. Yet, is that reflective of the true value of labor? No, it is not because waged work is never scarce. It's planned and designed to do what it needs to do and then it is transformed into another task, which most of the time ends in an unpaid form like house chores or driving. Work is casual in its nature, which allows work that fulfills its nature to align with the needs of a community. We don’t need to force work into oppressive forms; we need work to emerge from living well together.

In essence, labor roles may be scarce, but work as a principle of human contribution is abundant, even when particular jobs are scarce. To view work as scarce, allows you to justify that working to address the specific needs of the community is more important than the non-specific needs of the community. The non-specific needs of the community can be addressed with emotional labor, which society seems to not deem this labor the glamorious title of work. By not placing emotional labor in the category of work, it artificially creates scarcity that worships the maximization of supplies, rather than recognizing the need to maximize mutual respect within society. Society should take a lesson from the stars.

If a star organized its atoms through needless hierarchy, it would perish long before life could emerge to imagine such a thing. In the same way, labor too declines when efficiency is replaced by rigid control. Our society needs to learn to give up unnecessary control and let the efficiency of causality lead us into better forms of labor. This is not calling for the end of government, but for the bigger issue at stake: the end of the hierarchical corporation as the dominant organizer of labor. Our progress comes from challenging those who want us to stay in place, since when we overcome with respect in mind, mankind becomes a more flourishing species.

I am merely stating the obvious, we need to obey the causality around us and the universe will receive our plea. You know who said this the best, Jesus Christ himself, who said that, “Seek the Kingdom of God above all else, and live righteously, and he will give you everything you need” (Matthew 6:33, NLT). This quote from Jesus Christ means that we need to give up on the organizer of our world and move towards God. God will save us from Hard Work, and through meaning, whatever difficult or not, inspires us to strive towards a collective agency to rebuild society from the ground up.

Now, seeing the critical failure of Hard Working Success, what can be done? We can develop a new success, called Lazy Success: not the refusal of effort, but success without oppressive toil. Lazy Success is the success of finishing watching a movie, finishing playing a spontaneous game, finishing a family get together, friendship, and love. This model of success is what people actually work for, instead of pay. We think we want pay,

but what we really seek through pay is leisure, family, friendship, and love. So, why stay in the line of doom, when you can simply leave that line and let the entropy of the universe take you towards what you truly want in life. Being within mutual respect will generate success as a consequence from our alignment to causality, as easy as getting wet in a pool. Within Hard Working Success, your actions will define your success, but in Lazy Success, your actions will reflect mutual respect organically. The one with Lazy Success is imprinted into the purpose of the universe rather than being a footnote, lost in the endless pages of history.

Purpose, Causality, and Success

Within Hard Work, purpose is described to be found within the preservation of the labor necessary to maintain one's Hard Working Success. In essence, anyone can lose their own success by losing their perseverance towards their own work. Yet, is this truly what purpose is in the real world? To be entrapped in constant toil, reaching for the stars, on a bunny that can never fly. Oh, the insanity of the model of Hard Working Success cannot be misunderstood! Purpose is not forged from our labor, but from our own recognition of how our labor is relational towards the causality of the universe. Therefore, the purpose of an action is not to preserve the action as is, but to continue the causal chain of events that will last as long as causality exists within the universe. Henceforth, this can be expressed by putting our willingness for the ownership of our labor away and placing that ownership into the causal will of God, for He will outlast anything we will ever do.

Letting our labor free, like how the moon rocks let their labor be at the mercy of causality, is what purpose is.

Nothing can be more purposeful than a rock on a dead planet, for those rocks formulate an immeasurably powerful imprint onto the cosmos for billions of years in their original state of being. Yet, when the moon rock eventually breaks up, what remains is that the moon rock becomes something else to impact the universe for another billion years. In essence, our ability to align with cause and effect is eternal and purposeful in the universe. Therefore, work that resists mutual flourishing can lose sight of the purpose that began it.

Henceforth, since causality is present in all of time and in every corner of the universe, then failure at work, in the family, and in life benefits us in the same way that success benefits us. This is due to failure and success being causal processes that follow cause and effect. The efficiency of the universe does not distinguish between your failures and success, oh what a blessing! Therefore, the purpose of an action is not in if we fail or succeed in such an action, but in when we embrace the causality of our failures or successes, as a core singular unit. We develop purpose when we give up on owning our failures and successes and to instead move on with what cause will create the next effect in our lives. Hence, success is emergent from our surroundings and we must reflect and recognize the successes around us, which cultivates towards the removal of individualized respect within our homes and communities.

Another type of success within causality is Communal Success, in which success is defined as a team effort onto causality. This is seen in sports, group projects, and even families. There can even be successes that are not discovered yet, since as long as we live under a monopoly of Hard Work, we cannot truly see the diversity of success within the universe. So, what then makes success successful? Success is successful when you generate shared flourishing for others and oneself that aligns itself with the direct causality of the events of the so-called successful action. In essence, no one form of success aligned with causality is the most successful, all successes aligned with direct causality will guide us towards prosperity.

Henceforth, Supply and Demand worships the least efficient form of success, Hard Working Success, since this form of success is costly and hard to obtain. Thus, Supply and Demand does things that are successful for itself, but not for all of humanity, which is best seen in the gap between productivity and pay within the contemporary USA. This happens because Supply and Demand's view of success is self-centered over the maximization of supplies to satisfy the most demands. In Hard Working Success, the mutually respectful good is an afterthought in the work, which maintains societal hierarchies and traditions within the confines of humanity.

Hence, if Hard Working Success is the least efficient form of success, then why don't we see Lazy Success dominating our world today? This is because Economic Materialism is

such an pervasive and inefficient system that its only way to be an obstacle to what is mutually good is to not be challenged. Therefore, once you start to challenge Supply and Demand, the fate of Supply and Demand will already be sealed. Economic Materialism and its tools are not efficient in bringing true efficiency to the world. Economic Materialism is only efficient for itself and its self preservation. Since Economic Materialism is engaging in a selfish endeavor, its goal of preservation will require a great amount of neglect towards other things. These other neglected things to Economic Materialism are humanity's moral well-being, our material well-being, and the well-being of all that is mutually beneficial within the universe.

Therefore, to escape the grasp of Hard Work and Economic Materialism, we need to be relational, and there are people, albeit, consumed by individualized respect for nature, who still nonetheless emphasize a relational mindset. These people are the Baka tribe of south-eastern Cameroon. The relational mindset of the Baka tribe is supported by Simon Hoyte et al. (2024), they state that, "For the Baka of Bemba, reciprocity as an explicit act is largely absent. Rather than giving material goods, presenting offerings, ritual acts or other means to 'give back' or 'give thanks' for something harvested from the forest, the emphasis is instead on celebrating the abundance of such things. The primary way this is expressed is through sharing" (1048). In essence, this practice of the Baka Tribe suggests flourishing may emerge more through shared abundance than preservation through possession. Are they perfect in their way of relationality? No. Although, the fact that they choose to be relational must be respected as a good choice, albeit a small choice in the

greater story of humanity. Yet, the Baka tribe's tradition on emphasizing abundance over giving thanks shows us that letting go of preservation in our own success and placing it in the wider causality of the universe will make us a more relational people that can see the contradictions presenting within an economy structured around Supply and Demand.

Therefore, to rid ourselves from the influence of Supply and Demand, we must look internally, not externally, to give our notions of success to God and his causal creation, instead of giving these notions of success to society. We need to do this because if people work, in any context, to gain their own ego, then it will reinforce the inefficient societal hierarchies of Economic Materialism, the philosophy of Supply and Demand. This will happen at the expense of your true success, so look at what is good to those around you and then you will become truly successful.

To be able to forge an internal drive towards success, humanity will need to use their agency, which is present within all of life. Agency is the most fundamental aspect of life itself. Before life got infected with Supply and Demand, life got agency to choose to be sourced in the mutual respect around it or the individualized respect around it. Therefore, within a Communal or Lazy Success, agency within the individual is needed to be sourced in mutual respect to others, in their mannerisms, work, and mutual respect to all within the actions being considered as successful. Therefore, the individual is still important in work, but the fuel in this fire is not coercion, like in Hard Work and individualized respect, but it is in easy work, like fun activities or joyful activities.

Some people might say that if we all worked in joyous laughter, then nothing will get done. Yet, when people are lazy within work, they are viewed as lazy because they are not maximizing the supplies and demands around them for the work project. The Partaceyist view of work sees this differently, which I have seen, in its efficient form, myself. I went on a missionary trip to North Carolina while I was organizing the Partaceyist work philosophy. While I was in North Carolina at the Carolina Rebuilding Ministry, I helped rebuild showers for the volunteers for the ministry. After I finished my work, I felt successful and I took a shower. Then, all of a sudden, an idea came into my head like a flash of lightning. I was viewing my showering, as if it was my own space to shower.

Although this space was not my own, the labor of my showering would have been impossible without the volunteers who built the showers. The shower heads, the walls, the tub, the curtains, everything was bought in a store, which was produced by workers. These workers then got the parts to make the stuff in the store from their suppliers, who got their stuff from other people. In essence, the success of taking a shower is not my own, but that success is shared by all who are directly affected by the labor of the shower, the volunteers and those who went to the store to get the specific materials to build the shower. Those that indirectly helped in the success of the shower can enjoy their success for the store or for the production of the product, but they must understand that this success of showering is not their own.

Meanwhile, I can be successful in the success of my shower, yet all things that are successful require the mutual respect of others to be achieved and deemed to be successful within the individual. Hard Working Success facilitates the individualization of interpretations of the Respect within one's observed success, which prevents the individual from seeing the whole picture of the success of the shower. Therefore, by thinking that you own the success of showering, you will feed the dominance of Economic Materialism within yourself, but it is an illusion! Success in isolation is no success at all.

Mutual Instruction and Labor Coordination

Also, while volunteering in North Carolina, independent from the conception of pay in my own work, I was repairing a house in Windsor, North Carolina. While I was working repairing the exterior walls of the house, I noticed that people were giving us instructions on how we should conduct our work. Yet, the way that they told us to fix the exterior wall sounded like their own individualized interpretations of Respect towards the exterior walls of the house. This kind of instruction of work is innately promoting individualized respect unto the workers of the work itself.

Thinking about this even harder, I noticed something horrifying. All work contains instruction, and wherever instruction becomes domination rather than coordination,

hierarchy reproduces itself inside labor. So, what can be done about this? First things first, the way of conducting instructions has to change, in accordance with entropy of the universe. This can be done by following the labor of the work in itself, through undertaking Mutual Instruction, which is guidance emerging through worker participation rather than imposed managerial command. This can be done by hammering nails in the places on the exterior wall that feel not tight towards the house.

One can hammer nails using the entropy of the universe by looking at the workplace and seeing what is needed. For instance, if a group of volunteers needed a ladder, you would know by looking at the work at hand, to grab a ladder for the volunteers. Detailed instructions should arise where needed, but not dominate where worker judgment can lead. When instructions are done, a strong faith should be present between the abilities to conduct the work for the instructor and the workers respectively.

This faith between the workers and the instructors must be emphasized, for the work to be mutually respectful. Since, an instructor cannot mutually respect workers, by not trusting in their own roles in the working project. Also, workers cannot do their roles properly, if they have no idea what to do, due to a lack of instructions, yet too many instructions will limit the creative freedom of the workers, encasing the workers into a mental frame of individualized interpretations on the respectfulness of their own labor. When instructions cross the line of care and understanding and into control and power, then these instructions increase the power of those commanding the work rather than

increasing the power of those that conduct the work.

Therefore, since Supply and Demand-based economic systems advocate for the maximization of supplies and demands, the commander of the work does not need the workers to dominate their own labor to get the job done. In Supply and Demand-based systems, command tends toward controlling labor inputs rather than cultivating worker judgment. Workers risk becoming instruments rather than participants. This lack of mutuality in instructions within work makes the work of the workers feel oppressive.

Therefore, what is needed are Mutual Instructions that are caused by the work environment itself, not by the instructor. The instructor needs to see the work environment and communicate with the workers about the most mutually respectful way to do the work, communicating the mission, but not the specifics of the mission, which can only be done by the workers directly affecting the work themselves. These instructions should be done by workers to workers, so that the instructions are shared in their interpretation amongst the community.

In essence, instructors are merely there to maintain the focus on the mutual respect within the labor, so that there can be a dedicated resistance to combat against the individualization of interpretations of Respect at work. In practice, this makes the workers have control over the workplace, with advice given to the workers, feeling the mutual respect of the materials they are using. This advice from instructors is meant to

help the workers, but just enough to give the workers the necessary education to see how mutual respect develops in their own labor. An instructor should not master the work over others, but cultivate others' mastery over the work.

Chapter 10

How to Start a Partaceyist Revolution

For this working project of Partaceyism, I as the instructor must, in detail, guide your focus on how to start the Partaceyist revolution, with you deciding on the specifics. We can start with the first phase in developing a Partaceyist society, which is to educate the people about the purpose of Partaceyist institutions, and the purpose of valuing mutual respect above Economic Materialism and its proxy philosophies. This can be done by local communities organizing themselves by using social media sites, like discord, to get into groups and teach each other about the functions and inner workings of Partaceyism. This can lead to thoughtful discussions about Partaceyist thought before the first Partaceyist institutions are even built. These communities look like book clubs and college clubs. An example of how to start this phase is to look at what I have already done. In early 2025, I started a Partaceyist college club to teach others about Partaceyist thought. This phase, the Education Phase, is extremely practical and it is the current stage of the Partaceyist revolution, as I am writing this book.

The Education Phase has the goal of teaching others about how to mutually respect

others, how Partaceyist institutions function, and develop how the Partaceyist movement should define what is or is not mutually respectful. The Partaceyist institutions that must be taught are institutions like the emotional market, Partaceyist governance, healthcare, education, philosophy, and so on. New ideas can even form beyond this book within the Education Phase of the Partaceyist revolution. The reason why the Partaceyist revolution does not start with building institutions is because a movement must understand its institutions before attempting to build them. Education tests Partaceyist doctrine, so that people can adapt different ideas to increase the likelihood of success for the Partaceyist movement.

When people are educated enough to value the Partaceyist institutions, they can cultivate the willingness and humbleness to be able to build these Partaceyist institutions that have been explained throughout this book. In the late stage of the Education Phase, communities can begin to organize a plan to develop Partaceyist pop-up shops in farm markets and local events to build a basic emotional market to experiment on what the people see as mutually respectful to society. The emotional market develops an economy in which as mutual respect increases, prices decrease and vice versa. The combination of high pay and low prices would incentivize trust with customers towards Partaceyist institutions. This trust can facilitate the development of a peaceful and decentralized committee to organize the path of the Partaceyist revolution. This decentralized committee of dedicated Partaceyists should organize within social media sites, community events, protests, and within public areas to spread the message of

Partaceyism.

In essence, extensive journalism will be needed to get the message of Partaceyism into the civic imagination of society, so that people would understand the value of Partaceyist pop-up shops. As the Partaceyist community increases in size, Partaceyist conferences can be organized to further bolster the media presence of Partaceyism and increase the networking capabilities of Partaceyist organizers. Ultimately, the Education Phase goes on until a durable critical mass has identified as Partaceyist and are capable of building Partaceyist institutions together.

Direct Action Phase

The second phase of the Partaceyist revolution is the Direct Action Phase. The Direct Action Phase of the Partaceyist revolution is the phase of the Partaceyist revolution, in which local Partaceyist businesses are developed to address the needs of their communities. I believe that the need for this phase will be serious because of our current absence of mutual respect within our communities. Partaceyist businesses can start by groups gathering their wealth and resources to start up an idea to mutually respect society. These groups are connected through college, book clubs, conferences, discord, and community events of the Education Phase of the Partaceyist revolution.

These networks can develop into a council or councils to govern the Partaceyist

business's operations and allow the Partaceyist revolution to expand beyond just using Partaceyist pop-up shops. These verging Partaceyist pop-up shops can utilize free services such as samples or product showcases to emphasize how their products will maximize the mutual respectfulness between the customer, environment, and the Partaceyist business.

Over time, customers will become loyal to the Partaceyist pop-up shops, stabilizing the Partaceyist pop-up shops into proper Partaceyist businesses. Yet, these verging Partaceyist businesses will be lacking in cash, which means that there would likely be a council of a few founders and volunteers making up the verging Partaceyist business. In this case, Partaceyist businesses will be reliant on the loyalty of their customer base to survive. Therefore, the founders and the volunteers of the verging Partaceyist business will need to focus on the quality of their products much more than their quantity. This is because customers will come back more often if your product is a high quality product that people mutually respect.

Within the verging Partaceyist business, prices will need to decrease in respect to the opinions of the customers, volunteers, and founders on the mutual respectfulness of the product towards society. Customer loyalty develops the stability needed to maintain the separation of price and payment, since the more customer loyalty there is, the more financial room the Partaceyist business has to decrease prices and increase wages. Hence, as the Partaceyist business develops a mutually respectful reputation, it develops a

financial bedrock that can be used to network further into the community and find other investment opportunities to increase the quantity of the products they produce.

The Partaceyist business can also use this increased revenue to invest into other companies' stock assets, to use the old addiction of profit within Capitalistic businesses to fund the verging Partaceyist revolution. In the beginning of the Direct Action Phase, the Partaceyist business should use its investments and profits to build up a wealth fund to afford to buy bank loans to establish a temporary monetary base to support its respect-based currency. This should happen so that the concept of the separation of price and payment can begin affordability, which can finally allow Partaceyist business councils to afford to pay for Partaceyist employees, in the Partaceyist way.

These Partaceyist business councils are made up of all volunteers, employees, and customers that spend over ⅔ of their lifetime being directly affected by a specific Partaceyist business. The Partaceyist business council makes decisions with an ⅔ majority within the council. These decisions guide the purpose of the Partaceyist business councils, which is to define what is mutually respectful for the business within their specific industry and to understand what is mutually respectful for the customers of the Partaceyist business. The Partaceyist business councils also decide when to standardize their emotional currency with other businesses and what investments to accept or deny within the Partaceyist business. This is done to protect the Partaceyist business from those who want to selfishly gain from the success of the Partaceyist business.

Henceforth, the verging Partaceyist businesses will need investments from the Supply and Demand economy and its local loyal community to grow to challenge the Supply and Demand dominated economic system. The Partaceyist businesses can also help with mutual aid programs to win over the support of the community, to back up the Partaceyist business with wealth and resources, which can facilitate the transition of volunteers into employees, like a proper business. Therefore, since Partaceyist businesses are small at this stage, they will still use money, but only until the local business environment favors an emotional currency over the Supply and Demand dominated currency.

Yet, the structure of the Partaceyist business must maintain the ability to pay its employees, especially when the Partaceyist businesses start taking on debt. This can be achieved by enforcing the valuing of mutual respect within the Partaceyist business. This can be done with cameras and workers recording their times worked on an app like TCP humanity within our modern economy. After the actions of workers are recorded, then artificial intelligence software can be used to determine the identity of the person working and the amount of defined actions that worker did, which is defined by how many tasks were given to the worker, for a given shift.

Then, for the actions that the worker did, the Partaceyist business will send an email to each employee to have them rate their defined actions on a 1 to 10 scale. To the Partaceyist business, a defined action is a task, like stocking a specific item or completing

a financial report. Then, a group of unbiased human services workers will look at each defined action and rate each defined action between 1 to 10, or whatever end value of the range that that institution collaboratively decides on. After doing the math of the emotional market, the pay of workers will be determined after the end respect values are put into the collective rise of the local Partaceyist business. Then, after a week or two, the workers are given their pay, as an equal amount, forged from their work and respectfulness within the institution, in the physical currency of the host nation that the Partaceyist business is within.

Prices can be sourced from mutual respect by cameras tracking products coming in and out of the Partaceyist businesses with QR codes on them. Once products are in the Partaceyist business, a price analyst goes to each uniquely standard product and determines how environmentally sustainable, how socially beneficial, and how overall the customer base mutually respects the product. The price analyst can get this data from statistical data received from reports from their suppliers, customers, and those directly affected by the product. Then, the price analyst can combine all of this data into a normal curve distribution, using artificial intelligence, to sort out the data and use the math of the emotional market to determine the price for each uniquely standard product.

Therefore, local Partaceyist businesses can use these methods of determining price and pay from mutual respect to base their product's price on mutual respect. Yet, the common acceptance of mutual respect as a currency will take time. Thus, as the Partaceyist

business transition from being loan-supported to mixed monetary loan and mutual respect currency supported, the Partaceyist business can gain access to more cash from the wider economy to temporarily establish a conversion between mutual respect and cash. At this stage this must be done so that the pay the employees deserve and the discrepancy of the revenue of the Partaceyist business can be reconciled. A mutual respect-based currency should be the dominant means of exchange when the local business environment accepts mutual respect as a currency.

Partaceyist businesses will maintain a mutually respectful profit from the generation of mutual respect within the workers of the Partaceyist business, increase in customer inflow from cheaper prices than the competition, and investors filling in the gaps in the finances of the Partaceyist business. Therefore, Partaceyist businesses, outnumbered and just starting out, will have to commit to using the power of the emotional market to stay afloat, for the confidence of their investors. Partaceyist businesses will try to outcompete larger Supply and Demand businesses by offering higher wages for workers, mutual respect generation for all participants, and extreme customer loyalty, whilst maintaining lower prices for customers.

The Partaceyist business will also need to get security for its wealth stockpiles and its products, which will be done by establishing an resetting of the value of the products to their Supply and Demand value, once products leave the Partaceyist business, or Partaceyist business district. This can be enforced with a scanner at the exit of the

Partaceyist business that scans the product and reports it to the artificial intelligence, so that the product can be identified as out of the local Partaceyist economy. This can also protect the value of the goods and services within the Partaceyist business by preventing people from exploiting the lower prices of the Partaceyist business for their own selfish gains.

The continuation of an emotional market within an Partaceyist business can incentivize other Partaceyist businesses to strengthen their mutual respect currency, so they can develop a more consistent and stable system of lower prices and increased pay. This can be done while also maintaining an environment of worker freedom, dignity, and mutual respect to all with accordance to Partaceyist values. When the emotional market locally stabilizes, then you know when the Partaceyist business is ready to scale up within the larger economy. A Partaceyist business can scale up by using its revenue generation to support mutual aid projects and to take a share of the mutual respect generated from these mutual aid projects to prove to banks that these investments are benefiting society. This can grow public awareness for the Partaceyist business, which develops into connections with charities that invest back into the Partaceyist business. This can lessen the debt burden of the Partaceyist business, making the Partaceyist business council more free to address community issues and support Partaceyist candidates for positions within the government.

The Partaceyist businesses with less debt burden can maintain their growth as an

emotional market by supporting other Partaceyist businesses, to expand the zone of the Partaceyist business district. This can lead to the Partaceyist businesses to slowly adapt towards relying more on its own generation of mutual respect rather than bank loans. Therefore, Partaceyist businesses are encouraged to work together in a unified movement to deal with the debt burden caused by creating a Partacey before its foundational emotional currency idea is widely accepted. As society accepts the emotional currency idea more and more, then efforts to standardized emotional currencies between Partaceyist businesses can take place. This can lead to an increased ease in trade between Partaceyist businesses. This is only possible at this point because Partaceyist businesses now have influence to achieve these standardization projects, at least within the scale of local Partaceyist business districts.

The Business Phase

Over time, a new phase of the Partaceyist revolution will happen, the Business Phase, in which Partaceyist businesses will try to convert Supply and Demand businesses to Partaceyist businesses. This can be done by Supply and Demand dominated businesses seeing the value prospects of the Partaceyist business model. Hence, Supply and Demand dominated businesses, in their own endless search for profit, will be driven to become Partaceyist to attract more workers, increase their customer inflow, and to get into the business of generating mutual respect for the community.

Within the Business Phase, Partaceyist businesses will start to scale up, due to accessing more resources within the overall environment the Partaceyist business is built within. To inspire myself on how to imagine how a Partaceyist business can scale up, I visited a factory in the global headquarters of Amway. While doing a tour of their factory, I learned that Amway decided to change the size of their energy drinks cans to reflect the change in customer demand for their energy drinks, since customers wanted larger cans than what the factory was producing. A Partaceyist business can adjust its product in a similar way, in which a change in the number of customers can aggregately change the view of what is mutually respectful within that customer base, since bigger customer bases hold more diverse viewpoints on what is considered mutually respectful.

For example, a factory that is small would focus on maximizing the quality of the product, like making the product organic or locally sourced. Meanwhile, a larger factory would focus on the quantity of the mutually respectful products produced. In essence, Partaceyist factories match the most mutually respectful desire for the size of cans for the customer base, using customer reports on their products and environmental considerations. This means that Partaceyist businesses can find it profitable when scaling up to decrease the size of their cans, to save the environment, by producing less cans while making those cans full enough to satisfy the customers in a mutually respectful way to the Partaceyist business, the customer, and to the environment.

This process of recalculating what is mutually respectful in a given customer base will be

very common at the Business Phase of the Partaceyist revolution. This model is different from the current Economic Materialist model because within Supply and Demand, the mutual respect of products is not accounted for, which makes products effectively amoral. So, if a product is profitable, but bad for the environment, then it will be prioritized by the Supply and Demand-based firm. Although, in a Partaceyist firm, what matters is the demand that is mutually respectful according to the customers and workers alike. The difference is that profit becomes dependent on the benefit of humanity instead of the benefit of humanity being dependent on profit.

As Partaceyist businesses grow, the mutual respect that centers the Partaceyist business will likely change, but what matters is that the good is mutually beneficial for customers, workers, and the environment. The emotional market will prevent individuals from trying to take over the Partaceyist business by making individual takeovers unprofitable, since such efforts go against the power of the councils, guided by the incentives of mutual respect, that dictate decisions within Partaceyist businesses. Therefore, as the scalability of the Partaceyist business increases, the Partaceyist business increasingly focuses on maintaining its decentralized structure by profiting off of its generation of mutual respect, embedding an incentive for the founders to stay alongside the council rather than trying to dominate it.

Partaceyist businesses desire scalability because masses of people having high opinion scores for the Partaceyist business is more profitable for the Partaceyist business than a

few people having high opinion scores for the business. When there is limitation on who has a say in the valuation of goods and services, it comes at the expense of the workers and customers affected by the Partaceyist business. All that are affected by an action are accountable to participate in the aggregate ranking of the value of such an action. Therefore, the Partaceyist business will survive, by its decentralization of authority and reliance on the emotional market to guide decisions.

Many people have stated to me that the collective rise will prevent those who would have earned more without a collectivization of pay to join the Partaceyist revolution. Although, that's not true at all. Due to the mutual respectfulness that becoming Partaceyist entails to the community, the rich will still want to be Partaceyist. This is because as the community gets used to mutual respect equating to lower prices, society would see Supply and Demand-based businesses as risky for not prioritizing mutual respect. Also, this commitment will increase their contribution to the collective rise, which increases everyone’s wealth within the society.

It will also be encouraged by Partaceyist businesses to ask for redemption for the turmoil that the rich have done to the poor. This can be achieved by giving the rich guaranteed dignified reintegration, through yearly donations from the Partaceyist business to the rich, in exchange for the rich relinquishing their concentrated power. In exchange for the stability of the rich, the rich must give their remaining excess wealth to the Partaceyist business, to keep their financial stability and prolong a mutual relationship between the

powerful and the Partaceyist movement to amplify the Partaceyist revolution. This strategy can make a more long-term equitable society, by making the rich live happily ever after, so that real momentum can be achieved and further fund the Partaceyist business to lobby for Partaceyist candidates.

The Partaceyist businesses can also use this newly added wealth to expand the Partaceyist businesses to new heights. As the Partaceyist firms fund their consolidation, this newly acquired wealth will eventually be used to do actions that increase the wealth funds of the collective rises of the Partaceyist businesses, which increases the pay of the workers of the Partaceyist businesses. Partaceyist firms will want to do this because it can give them a giant pool of wealth to fund their operations, and the rich will want to do it to give stability to themselves and their families, allowing the rich to be politically satisfied without resorting to manipulating the Partaceyist businesses for their self-interests. As this policy expands, the rich will become less of a threat to the interests of the Partaceyist revolution. This can allow Partaceyist businesses to reproduce institutions that reflect and further stabilize the emotional market within its supported community.

As the Partaceyist business districts grow to encompass entire communities, Partaceyist businesses can organize and further standardize their emotional currency that they use. This can foster economic unity between Partaceyist businesses and form an ease of trade between Partaceyist businesses within the nation. This can foster a coalition of Partaceyist businesses that share the same economic and social interests for the

Partaceyist revolution. This coalition gives support to newer Partaceyist firms, which increases the number of Partaceyist businesses within Partaceyist business districts. The increase of Partaceyist firms further strengthens the Partaceyist revolution because it makes it harder to destroy the Partaceyist revolution when more decentralized pillars of the Partaceyist revolution are created.

The coalition of Partaceyist businesses uses the experience of different Partaceyist firms from different industries to facilitate unified policies over their standardized emotional currency in multiple diverse industries. This allows the standardized emotional currency to become more stable, since its opinions are more diverse, which creates a more accurate picture of the aggregate mutual respect of the economy, at any given time. This process of Partaceyist businesses investing and growing will continue up till the Partaceyist firms become a 50% majority within the economy of the Supply and Demand dominated nation. Once the Partaceyist businesses become a 50% majority within the Supply and Demand dominated economy of the nation, then a decision must be made. Should the Partaceyist revolution wait until the Partaceyist businesses have a further majority within the Supply and Demand dominated economy, or should the Partaceyist revolution start its next phase?

The Governmental Phase

The next phase of the Partaceyist revolution is the Governmental Phase. The

Governmental Phase begins with the Partaceyist businesses organizing together, with the unified purpose of establishing a standard emotional currency and collective rise. This is done to implement Partaceyist policies to the fullest, to increase the mutually respectful profits of the Partaceyist firms. Thus, Partaceyist businesses will be incentivized, under the emotional market, to organize together to form a protest coalition against the rest of the Supply and Demand dominated businesses. Therefore, due to society's reliance on Partaceyist businesses at this time, the connections that the Partaceyist businesses made with the currently Supply and Demand dominated businesses can be ignored, for the benefit of humanity.

Therefore, as a consequence of forming a united protest coalition, Partaceyist businesses can organize civil resistance, through worker and customer strikes to block critical infrastructure of Supply and Demand dominated businesses. The worker and customer strikes can be politically and materially supported by the Partaceyist business protest coalition, such as establishing a temporary Universal Basic Income for the strikers. This can prolong the worker and customer strikes on critical infrastructure for Supply and Demand dominated businesses, to achieve the demands of the Partaceyist movement. Those demands are for all remaining Supply and Demand dominated businesses to become Partaceyist and to enforce a Partaceyist restructuring of government institutions towards a Partaceyist governing structure.

The protestors are supported by the Partaceyist businesses, therefore they can protest

indefinitely until their demands are satisfied, since an alternative self-sufficient economy is formed to combat Supply and Demand. Eventually, Supply and Demand will fall and when that happens an organized transitional committee will be established to govern the transition from an Economic Materialist economy to a Partaceyist economy. The transitional committee will be made up of hundreds of professionals that have the goal of guiding the establishment of elections for the head representative, elections for the People's Union, and the Partaceyist separation of powers.

The transitional committee members will be incentivized to do a good job and a reasonably speedy transition towards Partaceyism. This is because the Partaceyist businesses funding the operations of the transitional committee will want to do things well for the people, since the mutual respect of the people is their bottom line. The professionals are incentivized to not want to personally gain from the system because the emotional market makes it unprofitable to personally gain from the Partaceyist system. Also, within the transitional committee there will be a two-thirds majority among the professionals, which is required for the transitional committee to determine decisions with the implementation of the Partaceyist government structure.

Once the transitional committee is done with their duty, they will transfer power over towards the People's Union, while slowly losing relevance as they monitor elections and give recommendations for how the Partacey should function. The Governmental Phase of the Partaceyist revolution will end once the transitional committee gives all of its power

to the People's Union of the Partacey, which includes all citizens within the newly formed Partaceyist nation. Once the Governmental Phase of the Partaceyist revolution ends, then a new phase will arise, the International Phase.

The International Phase

The International Phase of the Partaceyist revolution starts with the newly formed Partaceyist nation establishing a stable and secure emotional economy within its sovereignty. This can be done by establishing a collective rise to centralize pay and an emotional market driven decentralized system for prices. This economic system should be supported by the People's Union and the Head Government, to ensure a time of emotional economic stability for the Partacey. When this time of stability comes, Supply and Demand nations will want to invest into this newly formed Partaceyist nation that has newly established economic institutions. This is supported by Peter Liberman (1996), who states that, “the British continued to trade freely with Germany until the outbreak of war in 1914, and the United States traded heavily with Japan until mid-1941. Even then, U.S. restrictions were intended as much to coerce Japan as to undermine its economy” (173). This quote shows us that rival nations tend to trade with each other as long as physically possible, it is the norm for rivals to trade, to mutually benefit each other, rather than to go to war and destroy each other.

Hence, when the Partaceyist nation prospers, I am confident that Supply and

Demand-dominated national rivals will develop a trade dependence with the newly forged Partacey. Therefore, when the wealth within the emotional economy is reliably generated, Supply and Demand dominated economies will want to profit from this newfound wealth, like how a new nation finds a new oil reserve. Yet, unlike the reserves of oil, emotions require cooperation to be generated, which makes the Supply and Demand dominated economies and firms forced to mutually cooperate with the Partaceyist firms, in a way that is mutually respectful to both partners of this international trade. This prevents other nations and foreign actors from controlling the resources of the Partaceyist nation, since without consent from the Partacey, no wealth can be generated within the international trade, since the resource that the firms are after is innately cooperative.

The Partaceyist nation must also at this time establish a centralized Locbalist governing body that governs the international trade of the Partacey, especially its zero-dollar policy. This zero-dollar policy protects the Partacey from exploitative labor practices from other nations that want to take the lesser prices of the Partacey, to enforce the dominance of Supply and Demand abroad. Therefore, the Partacey should enforce the zero-dollar policy, which will mutually respect the people by keeping the wealth within the nation, while increasing the pay of everyone within the Partaceyist nation.

Supply and Demand economies can also profit from the zero-dollar policy that is enforced via the international order that the Partaceyist nation facilitates into being. This

happens by the Supply and Demand dominated economies having a clean slate for imported products from the Partaceyist nation, so that the Supply and Demand dominated economies can use their unique allocation of customer demand and supplies within their own economies to price these products accordingly. When Supply and Demand dominated economies export to the Partaceyist nation, the wealth of the products for the Supply and Demand dominated nation will come back into their own firms and institutions.

This happens to the product once it leaves the sovereign territory of the Supply and Demand dominated nation. This allows the Partaceyist nation to receive a blank slate for exported products, which can allow the Partaceyist nation to value the products by its own values, not the values of the foreign exporters. In effect, the international order is the centralized organization of Locbalism, which is established from the consensus of the Partaceyist nation and the surrounding Supply and Demand nations. This facilitates trading relationships between the Supply and Demand nations and the Partaceyist nation.

This network of institutional diplomacy would disincentivize these Supply and Demand nations to invade the Partacey, since the exported products from the Partaceyist nation are also theirs to value when those products cross into their own nations. This makes a stable foundation for the Partaceyist nation to use its power to generate wealth from the direct power of its own people to influence the economies of the Supply and Demand nations. First, it will be small things, like favorable trade deals for the Partacey with other Supply

and Demand nations, with concessions of eliminating unsustainable and objectively mutually disrespectful social policies for Supply and Demand nations, like human rights violations and unnecessary pollution. Hence, Supply and Demand nations, seeing the productive value of the Partacey, will have to make a choice between an amoral economy or a moral economy.

The Supply and Demand dominated nations must give up unsustainable policies to trade with the Partacey or adopt an emotional currency of their own to protect their interests in trading with the Partacey. In either case, the Partaceyist revolution wins, since the Supply and Demand dominated nations will need to make a concession to address the mere existence of the new Partaceyist state. Over time, as Supply and Demand dominated nations obtain more concessions to gain more access into the market of the Partaceyist nation, these Supply and Demand-based nations will hybridize into a mixed Partaceyist and Supply and Demand economy. Therefore, aiding in the expansion of Partaceyism, which will spread further across the globe, via the use of peaceful international trade.

As this happens, the Locbalist centralized organization will slowly grow from a one-to-one international trading relationship, to a regional bloc. This regional bloc will comprise the Partaceyist nation, and the Supply and Demand dominated nations that are the closest economically towards the Partaceyist nation. Eventually, as this regional bloc develops supranational Locbalist institutions to maintain stability, contradictions would develop between the Supply and Demand model of economics and the internally growing

Partaceyist model of economics within these Supply and Demand dominated nations. These nations will be unable to challenge the internal Partaceyist movements within their nations because it will hurt their access to cheap prices from their trading relationships with other Partaceyist states. If they cut off their trading relationship with the Partacey, higher prices could lead to unrest, so even if a Supply and Demand nation did not want to concede, doing so would go against the longevity of the Supply and Demand-based order within that nation. Therefore, concessions in trading with Partaceyist states become structurally necessary for Supply and Demand nations.

The Partaceyist nation is not structurally pressured to make equivalent concessions to Supply and Demand dominated nations, because trade requires a mutual exchange, which is foundational to Partaceyism, but not to Supply and Demand. Why so? It is because Supply and Demand is an amoral economy that exists without the need of mutual interactions. Within an environment where mutuality guarantees prosperity, Supply and Demand would only guarantee poverty, so people would slowly abandon Supply and Demand and transition into a Partacey. Also, the market driven nature of this influence will facilitate sustainable grassroots Partaceyist movements within these Supply and Demand dominated nations.

Effectively, the Partaceyist nation will fool Economic Materialism to think that it can co-opt the Partaceyist economy. Yet, Economic Materialism will get lost in the maze of mutual respect, trying to find individualized respect, but it will be less abundant than it

was before and these individualized respect sourcing spots throughout the globe, facilitated through sin and failures, will become more isolated as Partaceyism grows in influence. Therefore, as time goes on, Partaceyist movements will have more practical examples to base their movements upon, to more effectively challenge Supply and Demand.

Henceforth, Partaceyist revolutions will eventually spring up across Supply and Demand economies that decided to be economically close to trading with Partaceyist nations. Facilitating the development of new Partaceyist nations that strengthen Partaceyism onto the global stage. The other Supply and Demand dominated nations will become insecure, seeing the rise of Partaceyism, but people within them will be driven by profits, which the Partacey supplies in plenty. The fact that mutual respect can be generated by the individual, independently of work, makes the employers and those in charge of Supply and Demand economies absolutely powerless in the face of this new form of profit. Militias within the Partaceyist nations will protect the citizens well, by enforcing mutually respectful strategies to increase recruits for the beautiful Partacey. These recruits can still live life as normal, but should be able to defend the Partacey, if war comes.

Yet, I do not think that war will come. The perceived profitability of Partaceyist collaboration will deter voters and politicians alike to go to war with the profitable Partaceyist nations. This process will continue to happen until Supply and Demand

becomes dethroned across the whole planet. One will be able to see the dethronement of Supply and Demand, when no more governing institutions impose a system of an increase in supplies leading to a decrease in demand, and vice versa. Henceforth, when this time comes, we will achieve a peaceful and mutually respectful world of Partaceyist institutions and nations alike.

Non-Violence and Mutual Respect

Henceforth, Partaceyism advocates for a non-violent revolution because nonviolent revolutions are more successful than violent revolutions. This is supported by Ivo K. Feierabend et al. (1973), they did a comparative study that showed that, “The obvious conclusion from this cross-national study of violence and coerciveness would indicate that political regimes that resort to force, especially if they use force inconsistently, must expect political instability and violence. On the other hand, the odds are overwhelmingly in favor of political stability for consistently permissive regimes” (419). In essence, this shows us that violence leads to inconsistency, which leads to unpredictability and fear to develop.

What Partaceyism gets right is that an organized revolution needs mutual respect as a foundational aspect of the society that the revolution is trying to transpire. In essence, we need a mutually respectful path towards the development of a Partacey because if we don’t, then our inconsistency with the efficiency of the universe, the efficiency of mutual

respect, will be our downfall as a species. Therefore, we must mutually respect others to live on, since we all require help to live and to be free. No one is free from their own merit; we are only able to gain freedom from the help of others. Therefore, to establish a Partacey, your first action must be to help others, for without helping others, there would be no humanity to speak of.

Author's Closing Message

My name is PhilosophizingDoodle. I am from a small town in Michigan, and as of writing this sentence, I am 23 years old. I first developed Partaceyism, back in 2018, when I was 16 years old. I remember seeing how my high school cross country team used mutual respect to be more efficient as a team. I want that for our economy. I have written this book with the intention of the solutions of Partaceyism to be shown first, then addressing the great problem that Partaceyism addresses. I wrote this book in that way to convey to you that what is most important right now is that we forge solutions to our problems. It is nice to understand what we are facing, but reading will only get us so far. Now, more than ever, we need action, we need plans and coordination to solve our problems. The great problem may be Supply and Demand, but we all know of the smaller problems that we face, which are the consequences of Supply and Demand. Addressing these smaller problems can weaken the pillars that keep Supply and Demand in power. Therefore, we need to act now, so go and do something. I respect everyone who has read this far into *The Partaceyist Statement*. Now, I state, go and make this world a more mutually respectful place once again.

Sincerely,

PhilosophizingDoodle
